wit implies in the author a Cambridge education, Costard and Dull and Holofernes imply familiarity with rustics and country schoolmasters. Where the author proves that he "could not have been more familiar with French politics if, like Bacon, he had spent three years in the train of an Ambassador to France," I cannot conjecture. *There are no French politics in the piece*, any more than there are "mysteries of fashionable life," such as Bacon might have heard of from Essex and Southampton. There is no "familiarity with all the gossip of the Court"; there is no greater knowledge of foreign proverbs than could be got from common English books. There is abundance, indeed overabundance of ridicule of affected styles, and quips, with which the literature of the day was crammed: call it Gongorism, Euphuism, or what you please. One does not understand how or where Judge Webb (in extreme old age) made all these discoveries, sympathetically quoted by Mr. Greenwood. "Like Bacon, the author of the play must have had a large command of books; he must have had his "Horace," his "Ovidius Naso," and his "good old 'Mantuan.'" What a prodigious "command of books"! Country schoolmasters confessedly had these books on the school desks. It was not even necessary for the author to "have access to the *Chronicles* of Monstrelet." It is not known, we have said, whether or not such plot as the play possesses, with King Ferdinand and the 100,000 ducats, or 200,000 ducats (needed to bring the Princess and the mythical King Ferdinand of Navarre together), were not adapted by the poet from an undiscovered *conte*, partly based on a passage in Monstrelet.

Perhaps it will be conceded that *Love's Labour's Lost* is not a play which can easily be attributed to Bacon. We do not know how much of the play existed before Shakespeare "augmented" it in 1598. We do not know whether what he then corrected and augmented was an early work of his own or from another hand, though probably it was his own. Molière certainly corrected and augmented and transfigured, in his illustrious career in Paris, several of the brief early sketches which he had written when he was the chief of a strolling *troupe* in Southern France.

Mr. Greenwood does not attribute the wit (such as it is), the quips, the conceits, the affectations satirised in *Love's Labour's Lost*, to Will's knowledge of the artificial style then prevalent in all the literatures of Western Europe, and in England most pleasingly used in Lyly's comedies. No, "the author must have been not only a man of high intellectual culture, but one who was intimately acquainted with the ways of the Court, and the fashionable society of his time, as also with contemporary foreign politics."

I search the play once more for the faintest hint of knowledge of foreign politics. The embassy of the daughter of the King of France (who, by the date of the affair of the ducats, should be Charles VII) has been compared to a diplomatic sally of the mother of the childless actual King of France (Henri III), in 1586, when Catherine de Medici was no chicken. I do not see in the embassy of the Princess of the story any "intimate acquaintance with contemporary foreign politics" about 1591–3. The introduction of Mayenne as an adherent of the King of Navarre, shows either a most confused ignorance of foreign politics on the part of the author, or a freakish contempt for his public. I am not aware that the author shows any "intimate acquaintance with the ways" of Elizabeth's Court, or of any other fashionable society, except the Courts which Fancy held in plays.

Mr. Greenwood appears to be repeating "the case as to this very remarkable play" as "well summed up by the late Judge Webb in his *Mystery of William Shakespeare*" (). In that paralysing judicial summary, as we have seen, "the author could not have been more familiar with French politics if, like Bacon, he had spent three years in the train of an Ambassador to France." The French politics, in the play, are to send the daughter of a King of France (the contemporary King Henri III was childless) to conduct a negotiation about 200,000 ducats, at the Court, steeped in peace, of a King of Navarre, a scholar who would fain be a recluse from women, in an Academe of his own device. Such was not the Navarre of Henri in his war with the Guises, and Henri did not shun the sex!

Such are the “contemporary foreign politics,” the “French politics” which the author knows — as intimately as Bacon might have known them. They are not foreign politics, they are not French politics, they are politics of fairy-land: with which Will was at least as familiar as Bacon.

These, then, are the arguments in favour of Bacon, or the Great Unknown, which are offered with perfect solemnity of assurance: and the Baconians repeat them in their little books of popularisation and propaganda. *Quantula sapientia*!

VII. CONTEMPORARY RECOGNITION OF WILL AS AUTHOR

It is absolutely impossible to prove that Will, or Bacon, or the Man in the Moon, was the author of the Shakespearean plays and poems. But it is easy to prove that Will was recognised as the author, by Ben Jonson, Heywood, and Heminge and Condell the actors, to take the best witnesses. Meanwhile we have received no hint that any man except Will was ever suspected of being the author till 1856, when the twin stars of Miss Delia Bacon and Mr. Smith arose. The evidence of Ben Jonson and the rest can only prove that professed playwrights and actors, who knew Will both on and off the stage, saw nothing in him not compatible with his work. Had he been the kind of letterless country fellow, or bookless fellow whom the Baconians and Mr. Greenwood describe, the contemporary witnesses cited must have detected Will in a day; and the story of the "Concealed Poet" who really, at first, did the additions and changes in the Company's older manuscript plays, and of the inconceivably impudent pretences of Will of Stratford, would have kept the town merry for a month. Five or six threadbare scholars would have sat down at a long table in a tavern room, and, after their manner, dashed off a Comedy of Errors on the real and the false playwright.

Baconians never seem to think of the mechanical difficulties in their assumed literary hoax. If Will, like the old Hermit of Prague who never saw pen and ink, could not even write, the hoax was a physical impossibility. If he could write, but was a rough bookless man, his condition would be scarcely the more gracious, even if he were able to copy in his scrawl the fine Roman hand of the concealed poet. I am surprised that the Baconians have never made that point. Will's "copy" was almost without blot or erasion, the other actors were wont to boast. Really the absence of erasions and corrections is too easily explained on the theory that Will was *not* the author. Will merely copied the fair copies handed to him by the concealed poet. The farce was played for some twenty

years, and was either undetected or all concerned kept the dread secret — and all the other companies and rival authors were concerned in exposing the imposture.

The whole story is like the dream of a child. We therefore expect the Anti-Willians to endeavour to disable the evidence of Jonson, Heywood, Heminge, and Condell. Their attempts take the shape of the most extravagant and complex conjectures; with certain petty objections to Ben's various estimates of the *merits* of the plays. He is constant in his witness to the authorship. To these efforts of despair we return later, when we hope to justify what is here deliberately advanced.

Meanwhile we study Mr. Greenwood's attempts to destroy or weaken the testimony of contemporary literary allusions, in prose or verse, to the plays as the work of the actor. Mr. Greenwood rests on an argument which perhaps could only have occurred to legal minds, originally, perhaps to the mind of Judge Webb, not in the prime vigour of his faculties. Not very many literary allusions remain, made during Will's life-time, to the plays of Shakespeare. The writers, usually, speak of "Shakespeare," or "W. Shakespeare," or "Will Shakespeare," and leave it there. In the same way, when they speak of other contemporaries, they name them, — and leave it there, without telling us "who" (Frank) Beaumont, or (Kit) Marlowe, or (Robin) Greene, or (Jack) Fletcher, or any of the others "were." All interested readers knew who they were: and also knew who "Shakespeare" or "Will Shakespeare" was. No other Will Shak(&c.) was prominently before the literary and dramatic world, in 1592–1616, except the Warwickshire provincial who played with Burbage.

But though the mere names of the poets, Ben Jonson, Kit Marlowe, Frank Beaumont, Harry Chettle, and so forth, are accepted as indicating the well-known men whom they designate, this evidence to identity does not satisfy Mr. Greenwood, and the Baconians, where Will is concerned. "We should expect to find allusions to dramatic and poetical works published under the name of 'Shakespeare'; we should expect to find Shakespeare spoken of as a poet and a dramatist; we should expect, further, to find some few allusions to Shakespeare or Shakspere the player. And these, of course, we do find; but these are not the

objects of our quest. What we require is evidence to establish the identity of the player with the poet and dramatist; to prove that the player was the author of the *Plays* and *Poems*. *That* is the proposition to be established, and *that* the allusions fail, as it appears to me, to prove," says Mr. Greenwood. He adds, "At any rate they do not disprove the theory that the true authorship was hidden under a pseudonym" — which raises an entirely different question.

Makers of allusions to the plays must identify Shakespeare with the actor, explicitly; must tell us who this Shakespeare was, though they need not, and usually do not, tell us who the other authors mentioned were; and though the world of letters and the Stage knew but one William Shakspere or Shakespeare, who was far too familiar to them to require further identification. But even if the makers of allusions did all this, and said, "by W. Shakespeare the poet, we mean W. Shakespeare the actor" — *that* is not enough. For they may all be deceived, may all believe that a bookless, untutored man is the author. So we cannot get evidence correct enough for Mr. Greenwood.

Destitute as I am of legal training, I leave this notable way of disposing of the evidence to the judgement of the Bench and the Bar, a layman intermeddleth not with it. Still, I am, like other readers, on the Jury addressed, — I do not accept the arguments. *Miror magis*, as Mr. Greenwood might quote Latin. We have already seen one example of this argument, when Heywood speaks of the author of poems by Shakespeare, published in *The Passionate Pilgrim*. Heywood does nothing to identify the actor Shakspere with the author Shakespeare, says Mr. Greenwood. I shall prove that, elsewhere, Heywood does identify them, and no man knew more of the world of playwrights and actors than Heywood. I add that in his remarks on *The Passionate Pilgrim*, Heywood had no need to say "by W. Shakespeare I mean the well-known actor in the King's Company." There was no other William Shakspere or Shakespeare known to his public.

It is to no purpose that Mr. Greenwood denies, as we have seen above, that the allusions "disprove the theory that the true authorship was hidden under a pseudonym." That is an entirely different question. He is now starting quite another hare. Men of letters who alluded to the plays and poems of William

Shakespeare, meant the actor; that is my position. That they may all have been mistaken: that "William Shakespeare" was Bacon's, or any one's pseudonym, is, I repeat, a wholly different question; and we must not allow the critic to glide away into it through an "at any rate"; as he does three or four times. So far, then, Mr. Greenwood's theory that it was impossible for the actor Shakspere to have been the author of the plays, encounters the difficulty that no contemporary attributed them to any other hand: that none is known to have said, "This Warwickshire man cannot be the author."

"Let us, however, examine some of these allusions to Shakspere, real or supposed," says the critic. He begins with the hackneyed words of the dying man of letters, Robert Greene, in *A Groatsworth of Wit* (1592). The pamphlet is addressed to Gentlemen of his acquaintance "that spend their wits in making plays"; he "wisheth them a better exercise," and better fortunes than his own. (Marlowe is supposed to be one of the three Gentlemen playwrights, but such suppositions do not here concern us.) Greene's is the ancient feud between the players and the authors, between capital and labour. The players are the capitalists, and buy the plays out and out, — cheap. The author has no royalties; and no control over the future of his work, which a Shakspere or a Bacon, a Jonson or a Chettle, or any handyman of the company owning the play, may alter as he pleases. It is highly probable that the actors also acquired most of the popular renown, for, even now, playgoers have much to say about the players in a piece, while they seldom know the name of the playwright. Women fall in love with the actors, not with the authors; but with "those puppets," as Greene says, "that speake from our mouths, these anticks, garnished in our colours." Ben Jonson, we shall see, makes some of the same complaints, — most natural in the circumstances: though he managed to retain the control of his dramas; how, I do not know. Greene adds that in his misfortunes, illness, and poverty, he is ungratefully "forsaken," by the players, and warns his friends that such may be *their* lot; advising them to seek "some better exercise." He then writes — and his meaning cannot easily be misunderstood, I think, but misunderstood it has been— "Yes, trust them not" (trust not the players), "FOR there is an upstart

crow, beautified with our feathers, that with his *Tyger's heart wrapt in a Player's hide*" ("Player's" in place of "woman's," in an old play, *The Tragedy of Richard*, *Duke of York*, &c.), "supposes he is as well able to bumbast out a blank verse as the best of you; and being an absolute *Johannes Factotum*, is in his own conceit the only Shake-scene in a country."

The meaning is pellucid. "Do not trust the players, my fellow playwrights, for the reasons already given, for they, in addition to their glory gained by mouthing *our* words, and their ingratitude, may now forsake you for one of themselves, a player, who thinks his blank verse as good as the best of yours" (including Marlowe's, probably). "The man is ready at their call" ("an absolute *Johannes Factotum*"). "In his own conceit" he is "the only Shake-scene in a country." "Seek you better masters," than these players, who have now an author among themselves, "the only Shake-scene," where the pun on Shakespeare does not look like a fortuitous coincidence. But it may be, anything may happen.

The sense, I repeat, is pellucid. But Mr. Greenwood writes that if Shake-scene be an allusion to Shakespeare "it seems clear that it is as an actor rather than as an author he is attacked." As an *actor* the person alluded to is merely assailed with the other actors, his "fellows." But he is picked out as presenting another and a new reason why authors should distrust the players, "*for* there is" among themselves, "in a player's hide," "an upstart crow" — who thinks his blank verse as good as the best of theirs. He is, therefore, necessarily a playwright, and being a *factotum*, can readily be employed by the players to the prejudice of Greene's three friends, who are professed playwrights.

Mr. Greenwood says that "we do not know why Greene should have been so particularly bitter against the players, and why he should have thought it necessary so seriously to warn his fellow playwrights against them." But we cannot help knowing; for Greene has told us. In addition to gaining renown solely through mouthing "*our*" words, wearing "*our* feathers," they have been bitterly ungrateful to Greene in his poverty and sickness; they will, in the same circumstances, as cruelly forsake his friends; "yes, for they now have" an author,

and to the playwrights a dangerous rival, in their own fellowship. Thus we know with absolute certainty why Greene wrote as he did. He says nothing about the superior financial gains of the players, which Mr. Greenwood suspects to have been the "only" cause of his bitterness. Greene gives its causes in the plainest possible terms, as did Ben Jonson later, in his verses "Poet-Ape" (Playwright-Actor). Moreover, Mr. Greenwood gives Greene's obvious motives on the very page where he says that we do not know them.

Even Mr. Greenwood, anxious as he is to prove Shake-scene to be attacked as an actor, admits that the words "supposes himself as well able to bumbast out a blank verse as the best of you," "do seem to have that implication," namely, that "Shake-scene" is a dramatic author: what else can the words mean; why, if not for the Stage, should Shake-scene write blank verse?

Finally Mr. Greenwood, after saying "it is clear that it is as an actor rather than as an author that 'Shake-scene' is attacked," concedes that it "certainly looks as if he" (Greene) "meant to suggest that this Shake-scene supposed himself able to compose, as well as to mouth verses." Nothing else can possibly be meant. "The rest of you" were authors, not actors.

If not, why, in a whole company of actors, should "Shake-scene" alone be selected for a special victim? Shake-scene is chosen out because, as an author, a factotum always ready at need, he is more apt than the professed playwrights to be employed as author by his company: this is a new reason for not trusting the players.

I am not going to take the trouble to argue as to whether, in the circumstances of the case, "Shake-scene" is meant by Greene for a pun on "Shakespeare," or not. If he had some other rising player-author, the Factotum of a cry of players, in his mind, Baconians may search for that personage in the records of the stage. That other player-author may have died young, or faded into obscurity. The term "the only Shake-scene" may be one of those curious coincidences which do occur. The presumption lies rather on the other side. I demur, when Mr. Greenwood courageously struggling for his case says that, even assuming the validity of the surmise that there is an allusion to Shakspere, "the utmost that we

should be entitled to say is that Greene here accuses Player Shakspere of putting forward, as his own, some work, or perhaps some parts of a work, for which he was really indebted to another" (the Great Unknown?). I do more than demur, I defy any man to exhibit that sense in Greene's words.

"The utmost that we should be entitled to say," is, in my opinion, what we have no shadow of a title to say. Look at the poor hackneyed, tortured words of Greene again. "Yes, trust them not; for there is an upstart crow, beautified with our feathers, that with his *Tyger's heart wrapped in a player's hide*, supposes he is as well able to bumbast out a blank verse as the best of you; and being an absolute *Johannes Factotum*, is in his own conceit the only Shake-scene in a country."

How can mortal man squeeze from these words the charge that "Player Shakspere" is "putting forward, as his own, some work, or perhaps some parts of a work, for which he was really indebted to another"? It is as an actor, with other actors, that the player is "beautified with *our* feathers," — not with the feathers of some one *not* ourselves, Bacon or Mr. Greenwood's Unknown. Mr. Greenwood even says that Shake-scene is referred to "as beautified with the feathers *which he has stolen* from the dramatic writers" ("our feathers").

Greene says absolutely nothing about feathers "*which he has stolen*." The "feathers," the words of the plays, were bought, not stolen, by the actors, "anticks garnished in our colours."

Tedious it is to write many words about words so few and simple as those of Greene; meaning "do not trust the players, for one of them writes blank verse which he thinks as good as the best of yours, and fancies himself the only Shake-scene in a country."

But "Greene here accuses Player Shakspere of putting forward, as his own, some work, or perhaps some parts of a work, for which he was really indebted to another," this is "the utmost we should be entitled to say," even if the allusion be to Shakspere. How does Mr. Greenwood get the Anti-Willian hypothesis out of Greene's few and plain words?

It is much safer for him to say that "Shake-scene" is not meant for Shakespeare. Nobody can prove that it *is*; the pun *may* be a strange coincidence, — or any one may say that he thinks it nothing more; if he pleases.

Greene nowhere "refers to this Shake-scene as being an impostor, an upstart crow beautified with the feathers *which he has stolen from the dramatic writers* ("our feathers")" — that is, Greene makes no such reference to Shake-scene in his capacity of writer of blank verse. Like all players, who are all "anticks garnisht in our colours," Shake-scene, *as player*, is "beautified with our feathers." It is Mr. Greenwood who adds "beautified with the feathers which he has *stolen* from the dramatic writers." Greene does not even remotely hint at plagiarism on the part of Shake-scene: and the feathers, the plays of Greene and his friends, were not stolen but bought. We must take Greene's evidence as we find it, — it proves that by "Shake-scene" he means a "poet-ape," a playwright-actor; for Greene, like Jonson, speaks of actors as "apes." Both men saw in a certain actor and dramatist a suspected rival. Only one such successful practising actor-playwright is known to us at this date (1592–1601), — and he is Shakespeare. Unless another such existed, Greene, in 1592, alludes to William Shak(&c.) as a player and playwright. This proves that the actor from Stratford was accepted in Greene's world as an author of plays in blank verse. He cannot, therefore, have seemed incapable of his poetry.

Let us now briefly consider other contemporary allusions to Shakespeare selected by Mr. Greenwood himself. No allusion can prove that Shakespeare was the author of the work attributed to him in the allusions. The plays and poems *may* have been by James VI and I, "a parcel-poet." The allusions can prove no more than that, by his contemporaries, Shakespeare was believed to be the poet, which is impossible if he were a mere rustic ignoramus, as the Baconians aver. Omitting some remarks by Chettle on Greene's *Groatsworth of Wit*, as, if grammar goes for all, they do not refer to Shakespeare, we have the Cambridge farce or comedy on contemporary literature, the *Return from Parnassus* (1602?). The University wits laugh at Shakespeare, — not an

university man, as the favourite poet, in his *Venus and Adonis*, of a silly braggart pretender to literature, Gullio.

They also introduce Kempe, the low comedy man of Shakespeare's company, speaking to Burbage, the chief tragic actor, of Shakespeare as a member of their company, who, *as an author of plays*, "puts down" the University wits "and Ben Jonson too." The date is not earlier than that of Ben's satiric play on the poets, *The Poetaster* (1601), to which reference is made. Since Kempe is to be represented as wholly ignorant, his opinion of Shakespeare's pre-eminent merit only proves, as in the case of Gullio, that the University wits decried the excellences of Shakespeare. In him they saw no scholar.

The point is that Kempe recognises Shakespeare as both actor and author.

All this "is quite consistent with the theory that Shakespeare was a pseudonym," says Mr. Greenwood. Of course it is, but it is *not* consistent with the theory that Shakespeare was an uneducated, bookless rustic, for, in that case, his mask would have fallen off in a day, in an hour. Of course the Cambridge author only proves, if you will, that *he* thought that *Kempe* thought, that his fellow player was the author. But we have better evidence of what the actors thought than in the Cambridge play.

In 1598, as we saw, Francis Meres in *Palladis Tamia* credits Shakespeare with *Venus and Adonis*, with privately circulated sonnets, and with a number of the comedies and tragedies. How the allusions "negative the hypothesis that Shakespeare was a *nom de plume* is not apparent," says Mr. Greenwood, always constant to his method. I repeat that he wanders from the point, which is, here, that the only William Shak(&c.) known to us at the time, in London, was credited with the plays and poems on all sides, which proves that no incompatibility between the man and the works was recognised.

Then Weaver (1599) alludes to him as author of *Venus*, *Lucrece*, *Romeo*, *Richard*, "more whose names I know not." Davies (1610) calls him "our English Terence" (the famous comedian), and mentions him as having "played some Kingly parts in sport." Freeman (1614) credits him with *Venus* and *Lucrece*. "Besides in plays thy wit winds like Meander." I repeat Heywood's

evidence. Thomas Heywood, author of that remarkable domestic play, *A Woman Killed with Kindness*, was, from the old days of Henslowe, in the fifteen-nineties, a playwright and an actor; he survived into the reign of Charles I. Writing on the familiar names of the poets, "Jack Fletcher," "Frank Beaumont," "Kit Marlowe," "Tom Nash," he says,

"Mellifluous Shakespeare whose enchanting quill
Commanded mirth and passion, was but 'Will.'"

Does Heywood not identify the actor with the author? No quibbles serve against the evidence.

We need not pursue the allusions later than Shakespeare's death, or invoke, at present, Ben Jonson's panegyric of 1623. As to Davies, his dull and obscure epigram is addressed "To our English Terence, Mr. Will Shakespeare." He accosts Shakespeare as "Good Will." He remarks that, "as some say," if Will "had not played some Kingly parts in sport," he had been "a companion for a *King*," and "been a King among the meaner sort." Nobody, now, can see the allusion and the joke. Shakespeare's company, in 1604, acted a play on the Gowrie Conspiracy of 1600. King James suppressed the play after the second night, as, of course, he was brought on the stage throughout the action: and in very droll and dreadful situations. Did Will take the King's part, and annoy gentle King Jamie, "as some say"? Nobody knows. But Mr. Greenwood, to disable Davies's recognition of Mr. Will as a playwright, "Our English Terence," quotes, from Florio's *Montaigne*, a silly old piece of Roman literary gossip, Terence's plays were written by Scipio and Laelius. In fact, Terence alludes in his prologue to the *Adelphi*, to a spiteful report that he was aided by great persons. The prologue may be the source of the fable — that does not matter. Davies might get the fable in Montaigne, and, knowing that some Great One wrote Will's plays, might therefore, in irony, address him as "Our English Terence." This is a pretty free conjecture! In Roman comedy he had only two names known to him to choose from; he took Terence, not Plautus. But if

Davies was in the great Secret, a world of others must have shared *le Secret de Polichinelle*. Yet none hints at it, and only a very weak cause could catch at so tiny a straw as the off-chance that Davies *knew*, and used "Terence" as a gibe.

The allusions, even the few selected, cannot prove that the actor wrote the plays, but do prove that he was believed to have done so, and therefore that he was not so ignorant and bookless as to demonstrate that he was incapable of the poetry and the knowledge displayed in his works. Mr. Greenwood himself observes that a Baconian critic goes too far when he makes Will incapable of writing. Such a Will could deceive no mortal. But does Mr. Greenwood, who finds in the Author of the plays "much learning, and remarkable classical attainments," or "a wide familiarity with the classics," suppose that his absolutely bookless Will could have persuaded his intimates that he was the author of plays exhibiting "a wide familiarity with the classics," or "remarkable classical attainments." The thing is wholly impossible.

I do not remember that a single contemporary allusion to Shakespeare speaks of him as "learned," erudite, scholarly, and so forth. The epithets for him are "sweet," "gentle," "honeyed," "sugared," "honey-tongued" — this is the convention. The tradition followed by Milton, who was eight years of age when Shakespeare died, and who wrote *L'Allegro* just after leaving Cambridge, makes Shakespeare "sweetest Shakespeare, Fancy's child," with "native wood-notes wild"; and gives to Jonson "the *learned* sock." Fuller, like Milton, was born eight years before the death of Shakespeare, namely, in 1608. Like Milton he was a Cambridge man. The First Folio of Shakespeare's works appeared when each of these two bookish men was aged fifteen. It would necessarily revive interest in Shakespeare, now first known as far as about half of his plays went: he would be discussed among lovers of literature at Cambridge. Mr. Greenwood quotes Fuller's remark that Shakespeare's "learning was very little," that, if alive, he would confess himself "to be never any scholar." I cannot grant that Fuller is dividing the persons of actor and author. Men of Shakespeare's generation, such as Jonson, did not think him learned; nor did men of the next generation. If Mr. Collins's view be correct, the men of Shakespeare's and of

Milton's generations were too ignorant to perceive that Shakespeare was deeply learned in the literature of Rome, and in the literature of Greece. Every one was too ignorant, till Mr. Collins came.

VIII. “THE SILENCE OF PHILIP HENSLOWE”

When Shakespeare is mentioned as an author by contemporary writers, the Baconian stratagem, we have seen, is to cry, “Ah, but you cannot prove the author mentioned to be the actor.” We have seen that Meres (1598) speaks of Shakespeare as the leading tragic and comic poet (“Poor poet-ape that would be thought our chief,” quoth Jonson), as author of *Venus and Adonis*, and as a sonneteer. “All this does nothing whatever to support the idea that the Stratford player was the author of the plays and poems alluded to,” says Mr. Greenwood, playing that card again.

The allusions, I repeat, *do* prove that Shak(&c.), the actor, was believed to be the author, till any other noted William Shak(&c.) is found to have been conspicuously before the town. “There is nothing at all to prove that Meres, native of Lincolnshire, had any personal knowledge of Shakespeare.” There is nothing at all to prove that Meres, native of Lincolnshire, had any personal knowledge of nine-tenths of the English authors, famous or forgotten, whom he mentions. “On the question — who was Shakespeare? — he throws no light.” He “throws no light on the question” “who was?” any of the poets mentioned by him, except one, quite forgotten, whose College he names . . . To myself this “sad repeated air,”— “critics who praise Shakespeare do not say *who Shakespeare* was,” — would appear to be, not an argument, but a subterfuge: though Mr. Greenwood honestly believes it to be an argument, — otherwise he would not use it: much less would he repeat it with frequent iteration. The more a man was notorious, as was Will Shakspere the actor, the less the need for any critic to tell his public “who Shakespeare was.”

As Mr. Greenwood tries to disable the evidence when Shakespeare is alluded to as an author, so he tries to better his case when, in the account-book of Philip Henslowe, an owner of theatres, money-lender, pawn-broker, purchaser of plays from authors, and so forth, Shakespeare is *not* mentioned at all. Here is a mystery which, properly handled, may advance the great cause. Henslowe has

notes of loans of money to several actors, some of them of Shakespeare's company, "The Lord Chamberlain's." There is no such note of a loan to Shakespeare. Does this prove that he was not an actor? If so, Burbage was not an actor; Henslowe never names him.

There are notes of payments of money to Henslowe after each performance of any play in one of his theatres. In these notes *the name of Shakespeare is never once mentioned as the author of any play*. How weird! But in *these* notes the names of the authors of the plays acted are never mentioned. Does this suggest that Bacon wrote all these plays?

On the other hand, there are frequent mentions of advances of money to authors who were working at plays for Henslowe, singly, or in pairs, threes, fours, or fives. We find Drayton, Dekker, Chapman, and nine authors now forgotten by all but antiquarians. We have also Ben Jonson (1597), Marston, Munday, Middleton, Webster, and others, authors in Henslowe's pay. *But the same of Shakespeare never appears*. Mysterious! The other men's names, writes Dr. Furness, occur "because they were all writers for Henslowe's theatre, but we must wait at all events for the discovery of some other similar record, before we can produce corresponding memoranda regarding Shaksper" (*sic*) "and his productions."

The natural mind of the ordinary man explains all by saying, "Henslowe records no loans of money to Shakspere the actor, because he lent him no money. He records no payments for plays to Shakespeare the author-actor, because to Henslowe the actor sold no plays." That is the whole explanation of the Silence of Philip Henslowe. If Shakspere did sell a play to Henslowe, why should that financier omit the fact from his accounts? Suppose that the actor was illiterate as Baconians fervently believe, and sold Bacon's plays, what prevented him from selling a play of Bacon's (under his own name, as usual) to Henslowe? To obtain a Baconian reply you must wander into conjecture, and imagine that Bacon forbade the transaction. Then *why* did he forbid it? Because he could get a better price from Shakspere's company? The same cause would produce the same effect on Shakspere himself; whether he were the author, or

were Bacon's, or any man's go-between. On any score but that of money, why was Henslowe good enough for Ben Jonson, Dekker, Heywood, Middleton, and Webster, and not good enough for Bacon, who did not appear in the matter at all, but was represented in it by the actor, Will? As a gentleman and a man of the Court, Bacon would be as much discredited if he were known to sell (for £6 on an average) his noble works to the Lord Chamberlain's Company, as if he sold them to Henslowe.

I know not whether the great lawyer, courtier, scholar, and philosopher is supposed by Baconians to have given Will Shakspere a commission on his sales of plays; or to have let him keep the whole sum in each case. I know not whether the players paid Shakspere a sum down for his (or Bacon's) plays, or whether Will received a double share, or other, or any share of the profits on them, as Henslowe did when he let a house to the players. Nobody knows any of these things.

"If Shakspere the player had been a dramatist, surely Henslowe would have employed him also, like the others, in that behalf." Henslowe would, if he could have got the "copy" cheap enough. Was any one of "the others," the playwrights, a player, holding a share in his company? If not, the fact makes an essential difference, for Shakspere *was* a shareholder. Collier, in his preface to Henslowe's so-called "Diary," mentions a playwright who was bound to scribble for Henslowe only (Henry Porter), and another, Chettle, who was bound to write only for the company protected by the Earl of Nottingham. Modern publishers and managers sometimes make the same terms with novelists and playwrights.

It appears to me that Shakspere's company would be likely, as his plays were very popular, to make the same sort of agreement with him, and to give him such terms as he would be glad to accept, — whether the wares were his own — or Bacon's. He was a keen man of business. In such a case, he would not write for Henslowe's pittance. He had a better market. The plays, whether written by himself, or Bacon, or the Man in the Moon, were at his disposal, and he did not dispose of them to Henslowe, wherefore Henslowe cannot mention him in his accounts. That is all.

Quoting an American Judge (Dr. Stotsenburg, apparently), Mr. Greenwood cites the circumstance that, in two volumes of Alleyn's papers "there is not one mention of such a poet as William Shaksper in his list of actors, poets, and theatrical comrades." If this means that Shakspere is not mentioned by Alleyn among actors, are we to infer that William was not an actor? Even Baconians insist that he was an actor. "How strange, how more than strange," cries Mr. Greenwood, "that Henslowe should make no mention in all this long diary, embracing all the time from 1591 to 1609, of the actor-author . . . No matter. *Credo quia impossibile*!" *Credo* what? and what is *impossible*? Henslowe's volume is no Diary; he does not tell a single anecdote of any description; he merely enters loans, gains, payments. Does Henslowe mention, say, Ben Jonson, *when he is not doing business with Ben*? Does he mention any actor or author except in connection with money matters? Then, if he did no business with Shakspere the actor, in borrowing or lending, and did no business with Shakespeare the author, in borrowing, lending, buying or selling, "How strange, how more than strange" it would be if Henslowe *did* mention Shakespeare! He was not keeping a journal of literary and dramatic jottings. He was keeping an account of his expenses and receipts. He never names Richard Burbage any more than he mentions Shakespeare.

Mr. Greenwood again expresses his views about this dark suspicious mystery, the absence of Shakespeare or Shakspere (or Shak, as you like it), from Henslowe's accounts, if Shak(&c.) wrote plays. But the mystery, if mystery there be, is just as obscure if the actor were the channel through which Bacon's plays reached the stage, for the pretended author of these masterpieces. Shak — was not the man to do all the troking, bargaining, lying, going here and there, and making himself a motley to the view for £0, 0*s.* 0*d.* If he were a sham, a figure-head, a liar, a fetcher-and-carrier of manuscripts, *he would be paid for it*. But he did not deal with Henslowe in his bargainings, and *that* is why Henslowe does not mention him. Mr. Greenwood, in one place, agrees, so far, with me. "Why did Henslowe not mention Shakespeare as the writer of other plays" (than *Titus Andronicus* and *Henry VI*)? "I think the answer is simple enough." (So do

I.) "Neither Shakspere nor 'Shakespeare' ever wrote for Henslowe!" The obvious is perceived at last; and the reason given is "that he was above Henslowe's 'skyline,'" "he" being the Author. We only differ as to *why* the author was above Henslowe's "skyline." I say, because good Will had a better market, that of his Company. I understand Mr. Greenwood to think, — because the Great Unknown was too great a man to deal with Henslowe. If to write for the stage were discreditable, to deal (unknown) with Henslowe was no more disgraceful than to deal with "a cry of players"; and as (unknown) Will did the bargaining, the Great Unknown was as safe with Will in one case as in the other. If Will did not receive anything for the plays from his own company (who firmly believed in his authorship), they must have said, "Will! dost thou serve the Muses and thy obliged fellows for naught? Dost thou give us two popular plays yearly, — gratis?"

Do you not see that, in the interests of the Great Secret itself, Will *had* to take the pay for the plays (pretended his) from somebody. Will Shakspere making his dear fellows and friends a present of two masterpieces yearly was too incredible. So I suppose he did have royalties on the receipts, or otherwise got his money; and, as he certainly did not get them from Henslowe, Henslowe had no conceivable reason for entering Will's name in his accounts.

Such are the reflections of a plain man, but to an imaginative soul there seems to be a brooding mist, with a heart of fire, which half conceals and half reveals the darkened chamber wherein abides "The Silence of Philip Henslowe." "The Silence of Philip Henslowe," Mr. Greenwood writes, "is a very remarkable phenomenon . . . " It is a phenomenon precisely as remarkable as the absence of Mr. Greenwood's name from the accounts of a boot-maker with whom he has never had any dealings.

"If, however, there was a man in high position, 'a concealed poet,'" who "took the works of others and rewrote and transformed them, besides bringing out original plays of his own . . . then it is natural enough that his name should not appear among those [of the] for the most part impecunious dramatists to whom Henslowe paid money for playwriting." Nothing can be more natural,

and, in fact, the name of Bacon, or Southampton, or James VI, or Sir John Ramsay, or Sir Walter Raleigh, or Sir Fulke Greville, or any other "man in high position," does *not* appear in Henslowe's accounts. Nor does the name of William Shak(&c.). But why should it not appear if Will sold either his own plays, or those of the noble friend to whom he lent his name and personality — to Henslowe? Why not?

Then consider the figure, to my mind impossible, of the great "concealed poet" "of high position," who can "bring out original plays of his own," and yet "takes the works of others," say of "sporting Kyd," or of Dekker and Chettle, and such poor devils, — *takes* them as a Yankee pirate-publisher takes my rhymes, — and "rewrites and transforms them."

Bacon (or Bungay) *cannot* "take" them without permission of their legal owners, — Shakspere's or any other company; — of any one, in short, who, as Ben Jonson says, "buys up reversions of old plays." How is he to manage these shabby dealings? Apparently he employs Will Shakspere, spells his own "*nom de plume*" "Shakespeare," and has his rewritings and transformations of the destitute author's work acted by Will's company. What a situation for Bacon, or Sir Fulke Greville, or James VI, or any "man in high position" whom fancy can suggest! The plays by the original authors, whoever they were, could only be obtained by the "concealed poet" and "man in high position" from the legal owners, Shakspere's company, usually. The concealed poet had to negotiate with the owners, and Bacon (or whoever he was) employed that scamp Will Shakspere, first, I think, to extract the plays from the owners, and then to pretend that he himself, even Will, had "rewritten and transformed them."

What an associate was our Will for the concealed poet; how certain it was that Will would blackmail the "man in high position"! "Doubtless" he did: we find Bacon arrested for debt, more than once, while Will buys New Place, in Stratford, with the money extorted from the concealed poet of high position. Bacon did associate with that serpent Phillips, a reptile of Walsingham, who forged a postscript to Mary Stuart's letter to Babington. But now, if not Bacon, then some other concealed poet of high position, with a mysterious passion for

rewriting and transforming plays by sad, needy authors, is in close contact with Will Shakspere, the Warwickshire poacher and ignorant butcher's boy, country schoolmaster, draper's apprentice, *enfin*, *tout le tremblement*.

"How strange, how more than strange!"

The sum of the matter seems to me to be that from as early as March 3, 1591, we find Henslowe receiving small sums of money for the performances of many plays. He was paid as owner or lessee of the House used by this or that company. On March 3, 1591, the play acted by "Lord Strange's (Derby's) men" was *Henry VI*. Several other plays with names familiar in Shakespeare's Works, such as *Titus Andronicus*, all the three parts of *Henry VI*, *King Leare* (April 6, 1593), *Henry V* (May 14, 1592), *The Taming of a Shrew* (June 11, 1594), and *Hamlet*, paid toll to Henslowe. He "received" so much, on each occasion, when they were acted in a theatre of his. But he never records his purchase of these plays; and it is not generally believed that Shakespeare was the author of all these plays, in the form which they bore in 1591–4: though there is much difference of opinion.

There is one rather interesting case. On August 25, 1594, Henslowe enters "*ne*" (that is, "a new play") "Received at the Venesyon Comodey, eighteen pence." That was his share of the receipts. The Lord Chamberlain's Company, that of Shakespeare, was playing in Henslowe's theatre at Newington Butts. If the "Venesyon Comodey" (Venetian Comedy) were *The Merchant of Venice*, this is the first mention of it. But nobody knows what Henslowe meant by "the Venesyon Comodey." He does not mention the author's name, because, in this part of his accounts he never does mention the author or authors. He only names them when he buys from, or lends to, or has other money dealings with the authors. He had none with Shakespeare, hence the Silence of Philip Henslowe.

IX. THE LATER LIFE OF SHAKESPEARE — HIS MONUMENT AND PORTRAITS

In the chapter on the Preoccupations of Bacon the reader may find help in making up his mind as to whether Bacon, with his many and onerous duties and occupations, his scientific studies, and his absorbing scientific preoccupation, is a probable author of the Shakespearean plays. Mr. Greenwood finds the young Shakspere impossible — because of his ignorance — which made him such a really good pseudo-author, and such a successful mask for Bacon, or Bacon's unknown equivalent. The Shakspere of later life, the well-to-do Shakspere, the purchaser of the right to bear arms; so bad at paying one debt at least; so eager a creditor; a would-be encloser of a common; a man totally bookless, is, to Mr. Greenwood's mind, an impossible author of the later plays.

Here, first, are moral objections on the ground of character as revealed in some legal documents concerning business. Now, I am very ready to confess that William's dealings with his debtors, and with one creditor, are wholly unlike what I should expect from the author of the plays. Moreover, the conduct of Shelley in regard to his wife was, in my opinion, very mean and cruel, and the last thing that we could have expected from one who, in verse, was such a tender philanthropist, and in life was — women apart — the best-hearted of men. The conduct of Robert Burns, alas, too often disappoints the lover of his *Cottar's Saturday Night* and other moral pieces. He was an inconsistent walker.

I sincerely wish that Shakespeare had been less hard in money matters, just as I wish that in financial matters Scott had been more like himself, that he had not done the last things that we should have expected him to do. As a member of the Scottish Bar it was inconsistent with his honour to be the secret proprietor of a publishing and a printing business. This is the unexplained moral paradox in the career of a man of chivalrous honour and strict probity: but the fault did not prevent Scott from writing his novels and poems. Why, then, should the few

bare records of Shakspere's monetary transactions make *his* authorship impossible? The objection seems weakly sentimental.

Macaulay scolds Scott as fiercely as Mr. Greenwood scolds Shakspere, — for the more part, ignorantly and unjustly. Still, there is matter to cause surprise and regret. Both Scott and Shakspere are accused of writing for gain, and of spending money on lands and houses with the desire to found families. But in the mysterious mixture of each human personality, any sober soul who reflects on his own sins and failings will not think other men's failings incompatible with intellectual excellence. Bacon's own conduct in money matters was that of a man equally grasping and extravagant. Ben Jonson thus describes Shakespeare as a social character: "He was indeed honest, and of an open and free nature . . . I loved the man and do honour his memory on this side idolatry as much as any." Perhaps Ben never owed money to Shakspere and refused to pay!

We must not judge a man's whole intellectual character, and declare him to be incapable of poetry, on the score of a few legal papers about matters of business. Apparently Shakspere helped that Elizabethan Mr. Micawber, his father, out of a pecuniary slough of despond, in which the ex-High Bailiff of the town was floundering, — pursued by the distraint of one of the friendly family of Quiney — Adrian Quiney. They were neighbours and made a common dunghill in Henley Street. I do not, like Mr. Greenwood, see anything "at all out of the way" in the circumstance "that a man should be writing *Hamlet*, and at the same time bringing actions for petty sums lent on loan at some unspecified interest." Nor do I see anything at all out of the way in Bacon's prosecution of his friend and benefactor, Essex (1601), while Bacon was writing *Hamlet*. Indeed, Shakspere's case is the less "out of the way" of the two. He wanted his loan to be repaid, and told his lawyer to bring an action. Bacon wanted to keep his head (of inestimable value) on his shoulders; or to keep his body out of the Tower; or he merely, as he declares, wanted to do his duty as a lawyer of the Crown. In any case, Bacon was in a tragic position almost unexampled; and was at once overwhelmed by work, and, one must suppose, by acute distress of mind, in the case of Essex. He must have felt this the more keenly, if, as some

Baconians vow, *he wrote the Sonnets to Essex*. Whether he were writing his *Hamlet* when engaged in Essex's case (1601), or any other of his dramatic masterpieces, even this astonishing man must have been sorely bestead to combine so many branches of business.

Thus I would reply to Mr. Greenwood's amazement that Shakspere, a hard creditor, and so forth, should none the less have been able to write his plays. But if it is meant that a few business transactions must have absorbed the whole consciousness of Shakespeare, and left him neither time nor inclination for poetry, consider the scientific preoccupation of Bacon, his parliamentary duties, his ceaseless activity as "one of the legal body-guard of the Queen" at a time when he had often to be examining persons accused of conspiracy, — and do not forget his long and poignant anxiety about Essex, his constant efforts to reconcile him with Elizabeth, and to advocate his cause without losing her favour; and, finally, the anguish of prosecuting his friend, and of knowing how hardly the world judged his own conduct. Follow him into his relations with James I; his eager pursuit of favour, the multiplicity of his affairs, his pecuniary distresses, and the profound study and severe labour entailed by the preparation for and the composition of *The Advancement of Learning* (1603–5). He must be a stout-hearted Baconian who can believe that, between 1599 and 1605, Bacon was writing *Hamlet*, and other masterpieces of tragedy or comedy. But all is possible to genius. What Mr. Greenwood's Great Unknown was doing at this period, "neither does he know, nor do I know, but he only." He, no doubt, had abundance of leisure.

At last Shakspere died (1616), and had not the mead of one melodious tear, as far as we know, from the London wits, in the shape of obituary verses. This fills Mr. Greenwood with amazement. "Was it because 'the friends of the Muses' were for the most part aware that Shakespeare had not died with Shakspere?" Did Jonson perchance think that his idea might be realised when he wrote,

"What a sight it were,
To see thee in our waters yet appear"?

and so on. Did Jonson expect and hope to see the genuine "Shakespeare" return to the stage, seven years after the death of Shakspere the actor, the Swan of Avon? As Jonson was fairly sane, we can no more suspect him of having hoped for this miracle than believe that most of the poets knew the actor not to be the author. Moreover Jonson, while desiring that Shakespeare might "shine forth" again and cheer the drooping stage, added,

"Which since thy flight from hence hath mourned like Night,
And despairs day, but for thy volume's light,"

that is — the Folio of 1623. Ben did not weave the amazing tissue of involved and contradictory falsities attributed to him by Baconians. Beaumont died in the same year as Shakspere, who died in the depths of the country, weary of London. Has Mr. Greenwood found obituary poems dropped on the grave of the famous Beaumont? Did Fletcher, did Jonson, produce one melodious tear for the loss of their friend; in Fletcher's case his constant partner? No? Were the poets, then, aware that Beaumont was a humbug, whose poems and plays were written by Bacon?

I am not to discuss Shakespeare's Will, the "second-best bed," and so forth. But as Shakespeare's Will says not a word about his books, it is decided by Mr. Greenwood that he had no books. Mr. Greenwood is a lawyer; so was my late friend Mr. Charles Elton, Q.C., of White Staunton, who remarks that Shakespeare bequeathed "all the rest of my goods, chattels, leases, &c., to my son-in-law, John Hall, gent." (He really *was* a "gent." with authentic coat-armour.)

It is with Mr. Elton's opinion, not with my ignorance, that Mr. Greenwood must argue in proof of the view that "goods" are necessarily exclusive of books, for Mr. Elton takes it as a quite natural fact that Shakespeare's books passed, with his other goods, to Mr. Hall, and thence to a Mr. Nash, to whom Mr. Hall left "my study of books" (library). I only give this as a lawyer's opinion.

There is in the Bodleian an Aldine Ovid, "with Shakespeare's" signature (merely Wm. She.), and a note, "This little volume of Ovid was given to me by

W. Hall, who sayd it was once Will Shakespeare's." I do not know that the signature (like that on Florio's *Montaigne*, in the British Museum) has been detected as a forgery; nor do I know that Shakespeare's not specially mentioning his books proves that he had none. Lawyers appear to differ as to this inference: both Mr. Elton and Mr. Greenwood seem equally confident. But if it were perfectly natural that the actor, Shakspere, should have no books, then he certainly made no effort, by the local colour of owning a few volumes, to persuade mankind that he *was* the author. Yet they believed that he was — really there is no wriggling out of it. As regards any of his own MSS. which Shakespeare may have had (one would expect them to be at his theatre), and their monetary value, if they were not, as usual, the property of his company, and of him as a member thereof, we can discuss that question in the section headed "The First Folio."

It appears that Shakespeare's daughter, Judith, could write no more than her grandfather. Nor, I repeat, could the Lady Jane Gordon, daughter of the great Earl of Huntly, when she was married to the Earl of Bothwell in 1566. At all events, Lady Jane "made her mark." It may be feared that Judith, brought up in that very illiterate town of Stratford, under an illiterate mother, was neglected in her education. Sad, but very common in women of her rank, and scarcely a proof that her father did not write the plays.

As "nothing is known of the disposition and character" of Shakespeare's granddaughter, Lady Barnard, who died in 1670, it is not so paralysingly strange that nothing is known of any relics or anecdotes of Shakespeare which she may have possessed. Mr. Greenwood "would have supposed that she would have had much to say about the great poet," exhibited his books (if any), and so forth. Perhaps she did, — but how, if we "know nothing about her disposition and character," can we tell? No interviewers rushed to her house (Abington Hall, Northampton-shire) with pencils and notebooks to record her utterances; no reporter interviewed her for the press. It is surprising, is it not?

The inference might be drawn, in the Baconian manner, that, during the Commonwealth and Restoration, "the friends of the Muses" knew that the actor

was *not* the author, and therefore did not interview his granddaughter in the country.

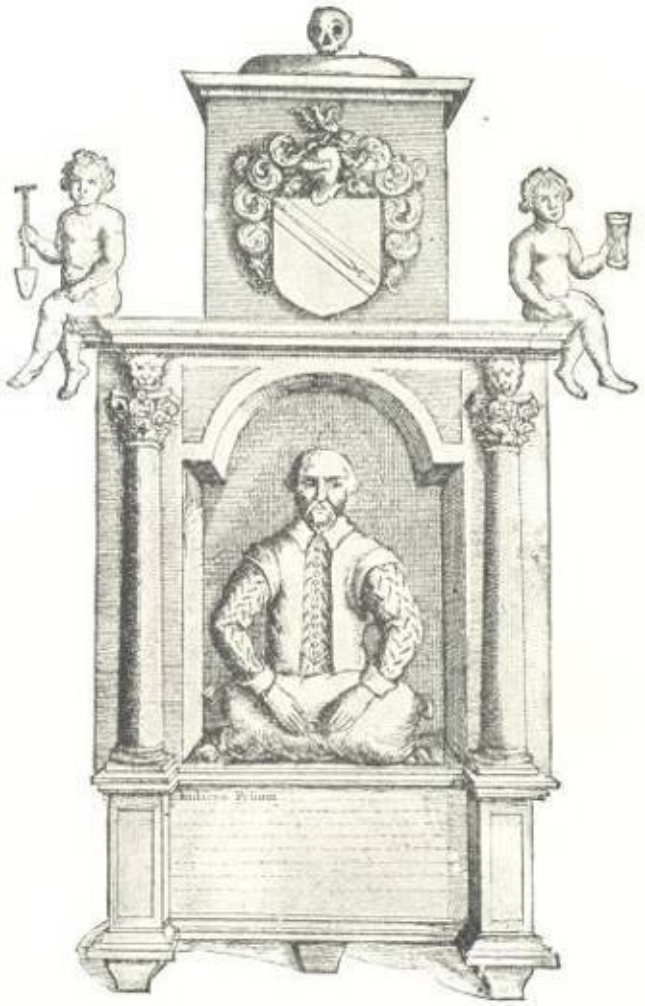
"But, at any rate, we have the Stratford monument," says Mr. Greenwood, and delves into this problem. Even the Stratford monument of Shakespeare in the parish church is haunted by Baconian mysteries. If the gentle reader will throw his eye over the photograph of the monument as it now exists, he may not be able to say to the face of the poet —

"Thou wast that all to me, Will,
For which my soul did pine."

But if he has any knowledge of Jacobean busts on monuments, he will probably agree with me in saying, "This effigy, though executed by somebody who was not a Pheidias, and who perhaps worked merely from descriptions, is, at all events, Jacobean." The same may assuredly be said of the monument; it is in good Jacobean style: the pillars with their capitals are graceful: all the rest is in keeping; and the two inscriptions are in the square capital letters of inscriptions of the period; not in italic characters. Distrusting my own *expertise*, I have consulted Sir Sidney Colvin, and Mr. Holmes of the National Portrait Gallery. They, with Mr. Spielmann, think the work to be of the early seventeenth century.

Next, glance at the figure opposite. This is a reproduction of "the earliest representation of the Bust" (and monument) in Dugdale's *Antiquities of Warwickshire* (1656). Compare the two objects, point by point, from the potato on top with holes in it, of Dugdale, which is meant for a skull, through all the details, — bust and all. Does Dugdale's print, whether engraved by Hollar or not, represent a Jacobean work? Look at the two ludicrous children, their legs dangling in air; at the lions' heads above the capitals of the pillars; at the lettering of the two visible words of the inscription, and at the gloomy hypochondriac or lunatic, clasping a cushion to his abdomen. That hideous design was not executed by an artist who "had his eye on the object," if the

object were a Jacobean monument: while the actual monument was fashioned in no period of art but the Jacobean. From Digges' rhymes in the Folio of 1623, we know that Shakespeare already had his "Stratford monument." *The existing object is what he had*; the monument in Dugdale is what, I hope, no architect of 1616–23 could have imagined or designed.



Dugdale's engraving is not a correct copy of any genuine Jacobean work of art. Is Dugdale accurate in his reproductions of other monuments in Stratford Church? To satisfy himself on this point, Sir George Trevelyan, as he wrote to me (June 13, 1912), "made a sketch of the Carew Renaissance monument in Stratford Church, and found that the discrepancies between the original tomb and the representation in Dugdale's *Warwickshire* are far and away greater than in the monument to William Shakespeare."

Mr. Greenwood, while justly observing that "the little sitting figures . . . are placed as no monumental sculptor would place them," "on the whole sees no reason at all why we should doubt the substantial accuracy of Dugdale's figure . . . It is impossible to suppose that Hollar would have drawn and that Dugdale would have published a mere travesty of the Stratford Monument."

I do not know who drew the design, but a travesty of Jacobean work it is in every detail of the monument. A travesty is what Dugdale gives as a representation of the Carew monument. Mr. Greenwood, elsewhere, repeating his criticism of the impossible figures of children, says: "This is certainly mere matter of detail, and, in the absence of other evidence, would give us no warrant for doubting the substantial accuracy of Dugdale's presentment of the 'Shakespeare' bust."

Why are we to believe that Dugdale's artist was merely fantastic in his design of the children (and also remote from Jacobean taste in every detail), and yet to credit him with "substantial accuracy" in his half-length of a gloomy creature clutching a cushion to his stomach? With his inaccuracies as to the Carew monument, why are we to accept him as accurate in his representation of the bust? Moreover, other evidence is not wanting. It is positively certain that the monument existing in 1748, was then known as "the original monument," and that no other monument was put in its place, at that date or later.

Now Mrs. Stopes argues that in 1748 the monument was "entirely reconstructed," and so must have become no longer what Dugdale's man drew, but what we see to-day. It is positively certain that her opinion is erroneous.

If ever what we see to-day was substituted for anything like what Dugdale's man drew, the date of the substitution is unknown.

Mrs. Stopes herself discovered the documents which disprove her theory. They were known to Halliwell-Phillipps, who quotes an unnamed "contemporary account." This account Mrs. Stopes, with her tireless industry, found in the Wheler manuscripts, among papers of the Rev. Joseph Greene, in 1746 Head Master of the Grammar School. In one paper of September 1740 "the original monument" is said to be "much impaired and decayed." There was a scheme for making "a new monument" in Westminster Abbey. *That*, I venture

to think, would have been in Hanoverian, not in Jacobean taste and style. But there was no money for a new monument. Mrs. Stopes also found a paper of November 20, 1748, showing that in September 1746, Mr. Ward (grandfather of Mrs. Siddons) was at Stratford with "a cry of players." He devoted the proceeds of a performance of *Othello* to the reparation of the then existing monument. The amount was twelve pounds ten shillings. The affair dragged on, one of the Churchwardens, a blacksmith, held the £12, 10*s.*, and was troublesome. The document of November 20, 1748, was drawn up to be signed, but was not signed, by the persons who appear to be chiefly concerned in the matter. It directed that Mr. Hall, a local limner or painter, is to "take care, according to his ability, that the monument shall become as like as possible to what it was when first erected." This appears to have been the idea of Mr. Greene. Another form of words was later adopted, directing Mr. Hall, the painter, "to repair and beautify, or to have the direction of repairing and beautifying, *the original monument* of Shakespeare the poet." Mrs. Stopes infers, justly in my opinion, that Hall "would fill up the gaps, restore what was amissing as he thought it ought to be, and finally repaint it according to the original colours, traces of which he might still be able to see." In his *History and Antiquities of Stratford-on-Avon*, Mr. Wheler tells us that this was what Hall did. "In the year 1748 the monument was carefully repaired, and the original colours of the bust, &c., as much as possible preserved by Mr. John Hall, limner, of Stratford."

It follows that we see the original monument and bust, but the painting is of 1861, for the bust, says Wheler, was in 1793 "painted in white," to please Malone. It was repainted in 1861.

Mrs. Stopes, unluckily, is not content with what Hall was told to do, and what, according to Wheler, he did. She writes: "It would only be giving good value for his money" (£12, 10*s.*) "to his churchwardens if Hall added (*sic*) a cloak, a pen, and manuscript." He "could not help changing" the face, and so on.

Now it was physically impossible to *add* a cloak, a pen, and manuscript to such a stone bust as Dugdale's man shows; to take away the cushion pressed to

the stomach, and to alter the head. Mr. Hall, if he was to give us the present bust, had to make an entirely new bust, and, to give us the present monument in place of that shown in Dugdale's print, had to construct an entirely new monument. Now Hall was a painter, not (like Giulio Romano) also an architect and sculptor. *Pour tout potage* he had but £12, 10*s.* He could not do, and he did not do these things! he did not destroy "the original monument" and make a new monument in Jacobean style. He was straitly ordered to "repair and beautify the original monument"; he did repair it, and repainted the colours. That is all. I do not quote what Halliwell-Phillipps tells us about the repairing of the forefinger and thumb of the right hand, and the pen; work which, he says, had to be renewed by William Roberts of Oxford in 1790. He gives no authority, and Baconians may say that he was hoaxed, or "lied with circumstance."

Mr. Greenwood quotes Halliwell-Phillipps's *Works of Shakespeare* (1853), in which he says that the design in Dugdale's book "is evidently too inaccurate to be of any authority; the probability being that it was not taken from the monument itself." Indeed the designer is so inaccurate that he gives the first word of the Latin inscription as "Judicyo," just as Oudry blunders in the Latin inscription of a portrait of Mary Stuart which he copied badly. Mr. Greenwood proceeds: "In his *Outlines* Halliwell simply ignores Dugdale. His engraving was doubtless too inconvenient to be brought to public notice!" Here Halliwell is accused of suppressing the truth; if he invented his minute details about the repeated reparation of the writing hand, — not represented in Dugdale's design, — he also lied with circumstance. But he certainly quoted a genuine "contemporary account" of the orders for repairing and beautifying the original monument in 1748, and I presume that he also had records for what he says about reparations of the hand and pen. He speaks, too, of substitutions for decayed alabaster parts of the monument, though not in his *Outlines*; and I observe that, in Mrs. Stopes's papers, there is record of a meeting on December 20, 1748, at which mention was made of "the materials" which Hall was to use for repairs.

To me the evidence of the style as to the date of both monument and bust speaks so loudly for their accepted date (1616–23) and against the Georgian date of 1748, that I need no other evidence; nor do I suppose that any one familiar with the monumental style of 1590–1620 can be of a different opinion. In the same way I do not expect any artist or engraver to take the engraving of the monument in Rowe's *Shakespeare* (1709), and that by Grignion so late as 1786, for anything but copies of the design in Dugdale, with modifications made *à plaisir*. In Pope's edition (1725) Vertue gives the monument with some approach to accuracy, but for the bald plump face of the bust presents a top-heavy and sculpturally impossible face borrowed from "the Chandos portrait," which, in my opinion, is of no more authority than any other portrait of Shakespeare. None of them, I conceive, was painted from the life.

The Baconians show a wistful longing to suppose the original bust, copied in Dugdale, to have been meant for Bacon; but we need not waste words over this speculation. Mr. Greenwood writes that "if I should be told that Dugdale's effigy represented an elderly farmer deploring an exceptionally bad harvest, 'I should not feel it to be strange!' Neither should I feel it at all strange if I were told that it was the presentment of a philosopher and Lord Chancellor, who had fallen from high estate and recognised that all things are but vanity."

"*I* should not feel it to be strange" if a Baconian told me that the effigy of a living ex-Chancellor were placed in the monument of the dead Will Shakspere, and if, on asking why the alteration was made, I were asked in reply, in Mr. Greenwood's words, "Was Dugdale's bust thought to bear too much resemblance to one who was not Shakspere of Stratford? Or was it thought that the presence of a woolsack" (the cushion) "might be taken as indicating that Shakspere of Stratford was indebted for support to a certain Lord Chancellor?" Such, indeed, are the things that Baconians might readily say: do say, I believe.

Dugdale's engraving reproduces the first words of a Latin inscription, still on the monument:

Judicio Pylium, *genio Socratem*, *arte Maronem*
Terra tegit, *populus mæret*, *Olympus habet*:

"Earth covers, Olympus" (heaven? or the Muses' Hill?) "holds him who was a Nestor in counsel; in poetic art, a Virgil; a Socrates for his Dæmon" ("Genius"). As for the "Genius," or dæmon of Socrates, and the permitted false quantity in making the first syllable of Socrates short; and the use of *Olympus* for heaven in epitaphs, it is sufficient to consult the learning of Mr. Elton. The poet who made such notable false quantities in his plays had no cause to object to another on his monument. We do not know who erected the monument, and paid for it, or who wrote or adapted the epitaph; but it was somebody who thought Shakespeare (or Bacon?) "a clayver man." The monument (if a trembling conjecture may be humbly put forth) was conceivably erected by the piety of Shakespeare's daughter and son-in-law, Mr. and Mrs. Hall. They exhibit a taste for the mortuary memorial and the queer Latin inscription. Mrs. Hall gratified the Manes of her poor mother, Mrs. Shakespeare, with one of the oddest of Latin epitaphs. It opens like an epigram in the Greek Anthology, and ends in an unusual strain of Christian mysticism. Mr. Hall possesses, perhaps arranged for himself, a few Latin elegiacs as an epitaph.

The famous "Good friend for Jesus' sake forbear," and so on, on the stone in the chancel, beneath which the sacred dust of Shakespeare lies, or lay, is the first of "the last lines written, we are told," "by the author of *Hamlet*." Who tells us that Shakespeare wrote the four lines of doggerel? Is it conceivable that the authority for Shakespeare's authorship of the doggerel is a tradition gleaned by Mr. Dowdall of Queen's in 1693, from a parish clerk, aged over eighty, he says, — criticism makes the clerk twenty years younger. For Baconians the lines are bad enough to be the work of William Shakspere of Stratford.

Meanwhile, in 1649, when Will's daughter, Mrs. Hall, died, her epitaph spoke quite respectfully of her father's intelligence.

"Witty above her sex, but that's not all,
Wise to salvation was good Mistris Hall,
Something of Shakespeare was in *that*, but *this*
Wholly of Him with whom she's now in bliss."

Thirty-three years after Shakespeare's death he was still thought "witty" in Stratford. But what could Stratford know? Milton and Charles I were of the same opinion; so was Suckling, and the rest of the generation after Shakespeare. But they did not know, how should they, that Bacon (or his equivalent) was the genuine author of the plays and poems. The secret, perhaps, so widely spread among "the friends of the Muses" in 1616, was singularly well kept by a set of men rather given to blab as a general rule.

I confess to be passing weary of the Baconian hatred of Will, which pursues him beyond his death with sneers and fantastic suspicions about his monument and his grave, and asks if he "died with a curse upon his lips, an imprecation against any man who might *move his bones*? A mean and vulgar curse indeed!" And the authority for the circumstance that he died with a mean and vulgar curse upon his lips?

About 1694, a year after Mr. Dowdall in 1693, and eighty years almost after Shakespeare's death, W. Hall, a Queen's man, Oxford (the W. Hall, perhaps, who gave the Bodleian Aldine Ovid, with Shakespeare's signature, true or forged, to its unknown owner), went to Stratford, and wrote about his pilgrimage to his friend Mr. Thwaites, a Fellow of Queen's. Mr. Hall heard the story that Shakespeare was the author of the mean and vulgar curse. He adds that there was a great ossuary or bone-house in the church, where all the bones dug up were piled, "they would load a great number of waggons." Not desiring this promiscuity, Shakespeare wrote the Curse in a style intelligible to clerks and sextons, "for the most part a very ignorant sort of people."

If Shakespeare *did*, that accommodation of himself to his audience was the last stroke of his wisdom, or his wit. Of course there is no evidence that he wrote the mean and vulgar curse: that he did is only the pious hope of the Baconians and Anti-Willians.

Into the question of the alleged portraits of Shakespeare I cannot enter. Ben spoke well of the engraving prefixed to the First Folio, but Ben, as Mr. Greenwood says, was anxious to give the Folio "a good send-off." The engraving is choicely bad; we do not know from what actual portrait, if from

any, it was executed. Richard Burbage is known to have amused himself with the art of design; possibly he tried his hand on a likeness of his old friend and fellow-actor. If so, he may have succeeded no better than Mary Stuart's embroiderer, Oudry, in his copy of the portrait of her Majesty.

That Ben Jonson was painted by Honthorst and others, while Shakespeare, as far as we know, was not, has nothing to do with the authorship of the plays. Ben was a scholar, the darling of both Universities; constantly employed about the Court in arranging Masques; his learning and his Scottish blood may have led James I to notice him. Ben, in his later years, was much in society; fashionable and literary. He was the father of the literary "tribe of Ben." Thus he naturally sat for his portrait. In the same way George Buchanan has, and had, nothing like the fame of Knox. But as a scholar he was of European reputation; haunted the Court as tutor of his King, and was the "good pen" of the anti-Marian nobles, Murray, Morton, and the rest. Therefore Buchanan's portrait was painted, while of Knox we have only a woodcut, done, apparently, after his death, from descriptions, for Beza's *Icones*. The Folio engraving may have no better source. Without much minute research it is hard to find authentic portraits of Mary Stuart, and, just as in Shakespeare's case, the market, in her own day and in the eighteenth century, was flooded with "mock-originals," not even derived (in any case known to me) from genuine and authentic contemporary works.

One thing is certain about the Stratford bust. Baconians will believe that Dugdale's man correctly represented the bust as it was in his time; and that the actual bust is of 1748, in spite of proofs of Dugdale's man's fantastic inaccuracy; in spite of the evidence of style; and in spite of documentary evidence that "the original monument" was not to be destroyed and replaced by the actual monument, but was merely "repaired and beautified" (painted afresh) by a local painter.

X. “THE TRADITIONAL SHAKSPERE”

In perusing the copious arguments of the Anti-Shakesperean but Non-Baconian Mr. Greenwood, I am often tempted, in Socratic phrase, to address him thus: Best of men, let me implore you, first, to keep in memory these statements on which you have most eloquently and abundantly insisted, namely, that society in Stratford was not only not literary, but was illiterate. Next pardon me for asking you to remember that the late sixteenth and the early seventeenth century did not resemble our fortunate age. Some people read Shakespeare’s, Beaumont’s, and Fletcher’s plays. This exercise is now very rarely practised. But nobody cared to chronicle literary gossip about the private lives and personal traits of these and several other Elizabethan and Jacobean playwrights, in the modern manner. Of Shakespeare (pardon, I mean Shakspere), the actor, there is one contemporary anecdote, in my poor opinion a baseless waggery. Of Beaumont there is none. Of a hand-maid of Fletcher, who drank sack in a tumbler, one anecdote appears at the end of the seventeenth century, — nothing better. Meanwhile of Shakspere the “traditions” must be sought either at Stratford or in connection with the London Stage; and in both cases the traditions began to be in demand very late.

As Stratford was not literary, indeed was terribly illiterate, any traditions that survived cannot conceivably have been literary. That is absolutely certain. Natives at Stratford had, by your own hypothesis, scant interest in literary anecdote. Fifty years after Shakespeare’s death, no native was likely to cherish tales of any sprouts of wit (though it was remembered in 1649, that he was “witty”), or any “wood-notes wild,” which he may have displayed or chirped at an early age.

Such things were of no interest to Stratford. If he made a speech when he killed a calf, or poached, or ran away to town, the circumstance might descend from one gaffer to another; he might even be remembered as “the best of his

family," — the least inefficient. Given your non-literary and illiterate Stratford, and you can expect nothing more, and nothing better, than we receive.

Let me illustrate by a modern example. In 1866 I was an undergraduate of a year's standing at Balliol College, Oxford, certainly not an unlettered academy. In that year, the early and the best poems of a considerable Balliol poet were published: he had "gone down" some eight years before. Being young and green I eagerly sought for traditions about Mr. Swinburne. One of his contemporaries, who took a First in the final Classical Schools, told me that "he was a smug." Another, that, as Mr. Swinburne and his friend (later a Scotch professor) were not cricketers, they proposed that they should combine to pay but a single subscription to the Cricket Club. A third, a tutor of the highest reputation as a moralist and metaphysician, merely smiled at my early enthusiasm, — and told me nothing. A white-haired College servant said that "Mr. Swinburne was a very quiet gentleman."

Then you take us to dirty illiterate Stratford, from fifty to eighty years after Shakspere's death, — a Civil War and the Reign of the Saints, a Restoration and a Revolution having intervened, — and ask us to be surprised that no anecdotes of Shakspere's early brilliance, a century before, survived at Stratford.

A very humble parallel may follow. Some foolish person went seeking early anecdotes of myself at my native town, Selkirk on the Ettrick. From an intelligent townsman he gathered much that was true and interesting about my younger brothers, who delighted in horses and dogs, hunted, shot, and fished, and played cricket; one of them bowled for Gloucestershire and Oxford. But about me the inquiring literary snipe only heard that "Andra was aye the stupid ane o' the fam'ly." Yet, I, too, had bowled for the local club, *non sine gloria*! Even *that* was forgotten.

Try to remember, best of men, that literary anecdotes of a fellow townsman's youth do not dwell in the memories of his neighbours from sixty to a hundred years after date. It is not in human nature that what was incomprehensible to the grandsire should be remembered by the grandson. Go to "Thrums" and ask for literary memories of the youth of Mr. Barrie.

Yet the learned Malone seems to have been sorry that little of Shakespeare but the calf-killing and the poaching, and the dying of a fever after drink taken (*where*, I ask you?), with Ben and Drayton, was remembered, so long after date, at Stratford, of all dirty ignorant places. Bah! how could these people have heard of Drayton and Ben? Remember that we are dealing with human nature, in a peculiarly malodorous and densely ignorant *bourgade*, where, however, the "wit" of Shakespeare was not forgotten (in the family) in 1649. See the epithet on the tomb of his daughter, Mrs. Hall.

You give us the Rev. John Ward, vicar of Stratford (1661–3), who has heard that the actor was "a natural wit," and contracted and died of a fever, after a bout with Drayton and Ben. I can scarcely believe that *these* were local traditions. How could these *rustauds* have an opinion about "natural wit," how could they have known the names of Ben and Drayton?

When you come to Aubrey, publishing in 1680, sixty years after Shakespeare's death, you neglect to trace the steps in the descent of his tradition. As has been stated, Beeston, "the chronicle of the Stage" (died 1682), gave him the story of the school-mastering; Beeston being the son of a servitor of Phillips, an actor and friend of Shakespeare, who died eleven years before that player. The story of the school-mastering and of Shakespeare "knowing Latin pretty well," is of no value to me. I think that he had some knowledge of Latin, as he must have had, if he were what I fancy him to have been, and if (which is mere hypothesis) he went for four years to a Latin School. But the story does not suit you, and you call it "a mere myth," which, "of course, will be believed by those who wish to believe it." But, most excellent of mortals, will it not, by parity of reasoning, "of course be disbelieved by those who do *not* wish to believe it"?

And do you want to believe it?

To several stage anecdotes of the actor as an excellent instructor of younger players, you refer slightingly. They do not weigh with me: still, the Stage would remember Shakspere (or Shakespeare) best in stage affairs. In reference to a very elliptic statement that, "in *Hamlet* Betterton benefited by Shakespeare's

coaching," you write, "This is astonishing, seeing that Shakspere had been in his grave nearly twenty years when Betterton was born. The explanation is that Taylor, of the Black Fryars Company, was, according to Sir William Davenant, instructed by Shakspere, and Davenant, who had seen Taylor act, according to Downes, instructed Betterton. There is a similar story about Betterton playing King Henry VIII. Betterton was said to have been instructed by Sir William, who was instructed by Lowen, who was instructed by Shakspere!"

Why a note of exclamation? Who was Downes, and what were his opportunities of acquiring information? He "was for many years book-keeper in the Duke's Company, first under Davenant in the old house . . . " Davenant was notoriously the main link between "the first and second Temple," the theatre of Shakespeare whom, as a boy, he knew, and the Restoration theatre. Devoted to the traditions of the stage, he collected Shakespearean and other anecdotes; he revived the theatre, cautiously, during the last years of Puritan rule, and told his stories to the players of the early Restoration. As his Book-keeper with the Duke of York's Company, Downes heard what Davenant had to tell; he also, for his *Roscius Anglicanus*, had notes from Charles Booth, prompter at Drury Lane. On May 28, 1663, Davenant reproduced *Hamlet*, with young Betterton as the Prince of Denmark. Davenant, says Charles Booth, "had seen the part taken by Taylor, of the Black Fryars Company, and Taylor had been instructed by the author," (not Bacon but) "Mr. William Shakespeare," and Davenant "taught Mr. Betterton in every particle of it." Mr. Elton adds, "We cannot be sure that Taylor was taught by Shakespeare himself. He is believed to have been a member of the King's Company before 1613, and to have left it for a time before Shakespeare's death." His name is in the list in the Folio of "the principall Actors in all these plays," but I cannot pretend to be certain that he played in them in Will's time.

It is Mr. Pepys (December 30, 1668) who chronicles Davenant's splendid revival of *Henry VIII*, in which Betterton, as the King, was instructed by Sir William Davenant, who had it from old Mr. Lowen, that had his instruction "from Mr. Shakespear himself." Lowin, or Lowen, joined Shakespeare's

Company in 1604, being then a man of twenty-eight. Burbage was the natural man for Hamlet and Henry VIII; but it is not unusual for actors to have "understudies."

The stage is notoriously tenacious of such traditions.

When we come with you to Mr. W. Fulman, about 1688, and the additions to his notes made about 1690–1708, we are concerned with evidence much too remote, and, in your own classical style, "all this is just a little mixed." With what Mr. Dowdall heard in 1693, and Mr. William Hall (1694) heard from a clerk or sexton, or other illiterate dotard at Stratford, I have already dealt. I do not habitually believe in what I hear from "the oldest aunt telling the saddest tale," — no, not even if she tells a ghost story, or an anecdote about the presentation by Queen Mary of her portrait to the ancestor of the Laird, — the portrait being dated 1768, and representing her Majesty in the bloom of girlhood. Nor do I care for what Rowe said (on Betterton's information), in 1709, about Shakespeare's schooling; nor for what Dr. Furnivall said that Plume wrote; nor for what anybody said that Sir John Mennes (Menzies?) said. But I do care for what Ben Jonson and Shakespeare's fellow-actors said; and for what his literary contemporaries have left on record. But this evidence you explain away by ætiological guesses, absolutely modern, and, I conceive, to anyone familiar with historical inquiry, not more valuable as history than other explanatory myths.

What Will Shakspere had to his literary credit when he died, was men's impressions of the seeing of his acted plays; with their knowledge, if they had any, of fugitive, cheap, perishable, and often bad reprints, in quartos, of about half of the plays. Men also had *Venus and Adonis*, *Lucrece*, and the Sonnets, which sold very poorly, and I do not wonder at it. Of the genius of Shakespeare England could form no conception, till the publication of the Folio (1623), not in a large edition; it struggled into a Third Edition in 1664. The *engouement* about the poet, the search for personal details, did not manifest itself with any vigour till nearly thirty years after 1664 — and we are to wonder that the gleanings, at illiterate Stratford, and in Stage tradition, are so scanty and so valueless. What

could have been picked up, by 1680–90, about Bacon at Gorhambury, or in the Courts of Law, I wonder.

XI. THE FIRST FOLIO

"The First Folio" is the name commonly given to the first collected edition of Shakespeare's plays. The volume includes a Preface signed by two of the actors, Heminge and Condell, panegyrical verses by Ben Jonson and others, and a bad engraved portrait. The book has been microscopically examined by Baconians, hunting for cyphered messages from their idol in italics, capital letters, misprints, and everywhere. Their various discoveries do not win the assent of writers like the late Lord Penzance and Mr. Greenwood.

The mystery as to the sources, editing, and selection of plays in the Folio (1623) appears to be impenetrable. The title-page says that *all* the contents are published "according to the true original copies." If *only* MS. copies are meant, this is untrue; in some cases the best quartos were the chief source, supplemented by MSS. The Baconians, following Malone, think that Ben Jonson wrote the Preface (and certainly it looks like his work), speaking in the name of the two actors who sign it. They say that Shakespeare's friends "have collected and published" the plays, have so published them "that whereas you were abus'd with divers stolne and surreptitious copies, maimed and deformed by the frauds and stealthes of injurious impostors that exposed them: *even those*" (namely, the pieces previously ill-produced by pirates) "are now offered to your view cur'd, and perfect of their limbes; and *all the rest*" (that is, all the plays which had not been piratically debased), "absolute in their numbers, as he conceived them." So obscure is the Preface that not *all* previously published separate plays are explicitly said to be stolen and deformed, but "*divers* stolen copies" are denounced. Mr. Pollard makes the same point in *Shakespeare Folios and Quartos*, (1909).

Now, as a matter of fact, while some of the quarto editions of separate plays are very bad texts, others are so good that the Folio sometimes practically reprints them, with some tinkerings, from manuscripts. Some quartos, like that of *Hamlet* of 1604, are excellent, and how they came to be printed from good

texts, and whether or not the texts were given to the press by Shakespeare's Company, or were sold, or stolen, is the question. Mr. Pollard argues, on grounds almost certain, that "we have strong *prima facie* evidence that the sale to publishers of plays afterwards duly entered on the Stationers' Registers was regulated by their lawful owners."

The Preface does not explicitly deny that some of the separately printed texts were good, but says that "divers" of them were stolen and deformed. My view of the meaning of the Preface is not generally held. Dr. H. H. Furness, in his preface to *Much Ado about Nothing* (), says, "We all know that these two friends of Shakespeare assert in their Preface to the Folio that they had used the Author's manuscripts, and in the same breath denounce the Quartos as stolen and surreptitious." I cannot see, I repeat, that the Preface denounces *all* the Quartos. It could be truly said that *divers* stolen and maimed copies had been foisted on "abused" purchasers, and really no more *is* said. Dr. Furness writes, "When we now find them using as 'copy' one of these very Quartos" (*Much Ado about Nothing*, 1600), "we need not impute to them a wilful falsehood if we suppose that in using what they knew had been printed from the original text, howsoever obtained, they held it to be the same as the manuscript itself . . . " That *was* their meaning, I think, the Quarto of *Much Ado* had *not* been "maimed" and "deformed," as divers other quartos, stolen and surreptitious, had been.

Shakspere, unlike most of the other playwrights, was a member of his Company. I presume that his play was thus the common good of his Company and himself. If they sold a copy to the press, the price would go into their common stock; unless they, in good will, allowed the author to pocket the money.

It will be observed that I understand the words of the Preface otherwise than do the distinguished Editors of the Cambridge edition. They write, "The natural inference to be drawn from this statement" (in the Preface) "is that *all* the separate editions of Shakespeare's plays were 'stolen,' 'surreptitious' and imperfect, *and that all those published in the Folio were printed from the*

author's own manuscripts" (my italics). The Editors agree with Dr. Furness, not with Mr. Pollard, whose learned opinion coincides with my own.

Perhaps it should be said that I reached my own construction of the sense of this passage in the Preface by the light of nature, before Mr. Pollard's valuable book, based on the widest and most minute research, came into my hands. By the results of that research he backs his opinion (and mine), that some of the quartos are surreptitious and bad, while others are good "and were honestly obtained." The Preface never denies this; never says that all the quartos contain maimed and disfigured texts. The Preface draws a distinction to this effect, "even those" (even the stolen and deformed copies) "are now cured and perfect in their limbs," — that is, have been carefully edited, while "*all the rest*" are "absolute in their numbers as he conceived them." This does not allege that all the rest are printed from Shakespeare's own holograph copies.

Among the plays spoken of as "all the rest," namely, those not hitherto published and not deformed by the fraudulent, are, *Tempest*, *Two Gentlemen*, *Measure for Measure*, *Comedy of Errors*, *As You Like It*, *All's Well*, *Twelfth Night*, *Winter's Tale*, *Henry VI*, iii., *Henry VIII*, *Coriolanus*, *Timon*, *Julius Cæsar*, *Macbeth*, *Antony and Cleopatra*, and *Cymbeline*. Also *Henry VI*, i., ii., *King John*, and *Taming of the Shrew*, appeared now in other form than in the hitherto published Quartos bearing these or closely similar names. We have, moreover, no previous information as to *The Shrew*, *Timon*, *Julius Cæsar*, *All's Well*, and *Henry VIII*. The Preface adds the remarkable statement that, whatever Shakespeare thought, "he uttered with that easinesse, that wee have scarce received from him a blot in his papers."

It is plain that the many dramas previously unpublished could only be recovered from manuscripts of one sort or another, because they existed in no other form. The Preface takes it for granted that the selected manuscripts contain the plays "absolute in their numbers as he conceived them." But the Preface does not commit itself, I repeat, to the statement that all of these many plays are printed from Shakespeare's own handwriting. After "as he conceived them," it goes on, "Who, as he was a most happy imitator of nature, was a most

gentle expresser of it. His mind and hand went together: and what he thought he uttered with that easiness, that we have scarce received from him a blot in his papers."

This may be meant to *suggest*, but does not *affirm*, that the actors *have* "all the rest" of the plays in Shakespeare's own handwriting. They may have, or may have had, some of his manuscripts, and believed that other manuscripts accessible to them, and used by them, contain his very words. Whether from cunning or design, or from the Elizabethan inability to tell a plain tale plainly, the authors or author of the Preface have everywhere left themselves loopholes and ways of evasion and escape. It is not possible to pin them down to any plain statement of facts concerning the sources for the hitherto unpublished plays, "the rest" of the plays.

These, at least, were from manuscript sources which the actors thought accurate, and some may have been "fair copies" in Shakespeare's own hand. (Scott, as regards his novels, sent his *prima cura*, his first writing down, to the press, and his pages are nearly free from blot or erasion. In one case at least, Shelley's first draft of a poem is described as like a marsh of reeds in water, with wild ducks, but he made very elegant fair copies for the press.) Let it be supposed that Ben Jonson wrote all this Preface, in accordance with the wishes and instructions of the two actors who sign it. He took their word for the almost blotless MSS. which they received from Shakespeare. He remarks, in his posthumously published *Discoveries* (notes, memories, brief essays), "I remember the players have *often* mentioned it as an honour to Shakespeare, that in his writing (whatsoever he penned) he never blotted out a line." And Ben gives, we shall later see, his habitual reply to this habitual boast.

As to the sources of such plays as had been "maimed and deformed by injurious impostors," and are now "offered cur'd and perfect of their limbs," "it can be proved to demonstration," say the Cambridge Editors, "that several plays in the Folio were printed from earlier quarto editions" (but the players secured a retreat on this point), "and that in other cases the quarto is more correctly printed, or from a better manuscript than the Folio text, and therefore of higher

authority." *Hamlet*, in the Folio of 1623, when it differs from the quarto of 1604, "differs for the worse in forty-seven places, while it differs for the better in twenty places."

Can the wit of man suggest any other explanation than that the editing of the Folio was carelessly done; out of the best quartos and MSS. in the theatre for acting purposes, and, — if the players did not lie in what they "often said," and if they kept the originals, — out of some MSS. received from Shakspere? Whether the two players themselves threw into the press, after some hasty botchings, whatever materials they had, or whether they employed an Editor, a very wretched Editor, or Editors, or whether the great Author, Bacon, himself was his own Editor, the preparation of a text was infamously done. The two actors, probably, I think, never read through the proof-sheets, and took the word of the man whom they employed to edit their materials, for gospel. The editing of the Folio is so exquisitely careless that twelve printer's errors in a quarto of 1622, of *Richard III*, appear in the Folio of 1623. Again, the *Merry Wives* of the Folio, is nearly twice as long as the quarto of 1619, yet keeps old errors.

How can we explain the reckless retention of errors, and also the large additions and improvements? Did the true author (Bacon or Bungay) now edit his work, add much matter, and go wrong forty-seven times where the quarto was right, and go right twenty times when the quarto was wrong? Did he, for the Folio of 1623, nearly double *The Merry Wives* in extent, and also leave all the errors of the fourth quarto uncorrected?

In that case how negligent was Bacon of his immortal works! Now Bacon was a scholar, and this absurd conduct cannot be imputed, I hope, to him.

Mr. Pollard is much more lenient than his fellow-scholars towards the Editor or Editors of the Folio. He concludes that "manuscript copies of the plays were easily procurable." Sixteen out of the thirty-six plays existed in quartos. Eight of the sixteen were not used for the Folio; five were used, "with additions, corrections, or alterations" (which must have been made from manuscripts). Three quartos only were reprinted as they stood. The Editors greatly preferred to use manuscript copies; and showed this, Mr. Pollard thinks, by placing plays,

never before printed, in the most salient parts of the three sets of dramas in their book. They did make an attempt to divide their plays into Acts and Scenes, whereas the quartos, as a general rule, had been undivided. But the Editors, I must say, had not the energy to carry out their good intentions fully — or Bacon or Bungay, if the author, wearied in well-doing. The work is least ill done in the Comedies, and grows worse and worse as the Editor, or Bacon, or Bungay becomes intolerably slack.

A great living author, who had a decent regard for his own works, could never have made or passed this slovenly Folio. Yet Mr. Greenwood argues that probably Bungay was still alive and active, after Shakspere was dead and buried. (Mr. Greenwood, of course, does not speak of Bungay, which I use as short for his Great Unknown.) Thus, *Richard III* from 1597 to 1622 appeared in six quartos. It is immensely improved in the Folio, and so are several other plays. Who made the improvements, which the Editors could only obtain in manuscripts? If we say that Shakespeare made them in MS., Mr. Greenwood asks, "What had he to work upon, since, after selling his plays to his company, he did not preserve his manuscript?" Now I do not know that he did sell his plays to his company. We are sure that Will got money for them, but we do not know what arrangement he made with his company. He may have had an author's rights in addition to a sum down, as later was customary, and he had his regular share in the profits. Nor am I possessed of information that "he did not preserve his manuscript." How can we know that? He may have kept his first draft, he may have made a fair copy for himself, as well as for the players, or may have had one made. He may have worked on a copy possessed by the players; and the publisher of the quartos of 1605, 1612, 1622, may not have been allowed to use, or may not have asked for the latest manuscript revised copy. The *Richard III* of the Folio contains, with much new matter, the printer's errors of the quarto of 1622. I would account for this by supposing that the casual Editor had just sense enough to add the new parts in a revised manuscript to the quarto, and was far too lazy to correct the printer's errors in the quarto. But Mr. Greenwood asks whether "the natural conclusion is not that 'some person

unknown' took the Quarto of 1622, revised it, added the new passages, and thus put it into the form in which it appeared in 1623." This natural conclusion means that the author, Bungay, was alive in 1622, and put his additions and improvements of recent date into the quarto of 1622, but never took the trouble to correct the errors in the quarto. And so on in other plays similarly treated. "Is it not a more natural conclusion that 'Shakespeare'" (Bungay) "himself revised its publication, and that some part of this revision, at any rate, was done after 1616 and before 1623."

Mr. Greenwood, after criticising other systems, writes, "There is, of course, another hypothesis. It is that Shakespeare" (meaning the real author) "did not die in 1616," and here follows the usual notion that "Shakespeare" was the "*nom de plume*" of that transcendent genius, "moving in Court circles among the highest of his day (as assuredly Shakespeare must have moved) — who wished to conceal his identity."

I have not the shadow of assurance that the Author "moved in Court circles," though Will would see a good deal when he played at Court, and in the houses of nobles, before "Eliza and our James." I never moved in Court circles: Mr. Greenwood must know them better than I do, and I have explained (see *Love's Labour's Lost*, and *Shakespeare*, *Genius*, *and Society*) how Will picked up his notions of courtly ways.

"Another hypothesis," the Baconian hypothesis,— "*nom de plume*" and all, — Mr. Greenwood thinks "an extremely reasonable one": I cannot easily conceive of one more unreasonable.

"Supposing that there was such an author as I have suggested, he may well have conceived the idea of publishing a collected edition of the plays which had been written under the name of Shakespeare, and being himself busy with other matters, he may have entrusted the business to some 'literary man,' to some 'good pen,' who was at the time doing work for him; and why not to the man who wrote the commendatory verses, the 'Lines to the Reader'" (opposite to the engraving), "and, as seems certain, the Preface, 'to the great variety of Readers'?"

That man, that "good pen," was Ben Jonson. On the "supposing" of Mr. Greenwood, Ben is "doing work for" the Great Unknown at the time when "the business" following on the "idea of publishing a collected edition of the plays which had been written under the name of Shakespeare" occurred to the illustrious but unknown owner of that "*nom de plume*." In plain words of my own, — the Author may have entrusted "the business," and what was that business if not the editing of the Folio? — to Ben Jonson— "who was at the time doing work for him" — for the Author.

Here is a clue! We only need to know for what man of "transcendent genius, universal culture, world-wide philosophy . . . moving in Court circles," and so on, Ben "was working" about 1621–3, the Folio appearing in 1623.

The heart beats with anticipation of a discovery! "On January 22, 1621, Bacon celebrated his sixtieth birthday with great state at York House. Jonson was present," and wrote an ode, with something about the Genius of the House (*Lar* or Brownie), "Thou stand'st as if some mystery thou didst."

Mr. Greenwood does not know what this can mean; nor do I.

"Jonson, it appears" (on what authority?), "was Bacon's guest at Gorhambury, and was one of those good 'pens,'" of whom Bacon speaks as assisting him in the translation of some of his books into Latin.

Bacon, writing to Toby Mathew, June 26, 1623, mentions the help of "some good pens," Ben Jonson he does not mention. But Judge Webb does. "It is an undoubted fact," says Judge Webb, "that the Latin of the *De Augmentis*, which was published in 1623, was the work of Jonson." To whom Mr. Collins replies, "There is not a particle of evidence that Jonson gave to Bacon the smallest assistance in translating any of his works into Latin."

Très bien, on Judge Webb's assurance the person for whom Ben was working, in 1623, was Bacon. Meanwhile, Mr. Greenwood's "supposing" is "that there was such an author" (of transcendent genius, and so on), who "may have entrusted the editing of his collected plays" to some "good pen," who was at the time "doing work for him," and "why not to" — Ben Jonson. Now the

man for whom Ben, in 1623, was "doing work" — was Bacon, — so Judge Webb says.

Therefore, by this hypothesis of Mr. Greenwood, the Great Unknown was Bacon, — just the hypothesis of the common Baconian.

Is my reasoning erroneous? Is the "supposing" suggested by Mr. Greenwood any other than that of Miss Delia Bacon, and Judge Webb? True, Mr. Greenwood's Baconian "supposing" is only a working hypothesis: not a confirmed belief. But it is useful to his argument (see "Ben Jonson and Shakespeare") when he wants to explain away Ben's evidence, in his verses in the Folio, to the Stratford actor as the Author.

Mr. Greenwood writes, in the first page of his Preface: "It is no part of my plan or intention to defend that theory," "the Baconian theory." Apparently it pops out contrary to the intention of Mr. Greenwood. But pop out it does: at least I can find no flaw in the reasoning of my detection of Bacon: I see no way out of it except this: after recapitulating what is said about Ben as one of Bacon's "good pens" with other details, Mr. Greenwood says, "But no doubt that way madness lies!" Ah no! not madness, no, but Baconism "lies that way." However, "let it be granted" (as Euclid says in his sportsmanlike way) that Mr. Greenwood by no means thinks that his "concealed poet" is Bacon — only some one similar and similarly situated and still active in 1623, and occupied with other business than supervising a collected edition of plays written under his "*nom de plume*" of Shakespeare. Bacon, too, was busy, with supervising, or toiling at the Latin translation of his scientific works, and Ben (according to Judge Webb) was busy in turning the *Advancement of Learning* into Latin prose. Mr. Greenwood quotes, without reference, Archbishop Tenison as saying that Ben helped Bacon in doing his works into Latin. Tenison is a very late witness. The prophetic soul of Bacon did not quite trust English to last as long as Latin, or he thought Latin, the *lingua franca* of Europe in his day, more easily accessible to foreign students, as, of course, it was. Thus Bacon was very busy; so was Ben. The sad consequence of Ben's business, perhaps, is that the editing

of the Folio is notoriously bad; whether Ben were the Editor or not, it is infamously bad.

Conceivably Mr. Greenwood is of the same opinion. He says, "It stands admitted that a very large part of that volume" (the Folio) "consists of work that is not 'Shakespeare's' at all."

How strange, if Ben edited it for the Great Unknown — who knew, if any human being knew, what work was "Shakespeare's"! On Mr. Greenwood's hypothesis, or "supposing," the Unknown Author "may well have conceived the idea of publishing a collected edition of the plays which had been written" (not "published," *written*) "under the name of Shakespeare, and, being himself busy with other matters, he may have entrusted the business to" some "good pen," "and why not to" — Ben. Nevertheless "a very large part of that volume consists of work that is not 'Shakespeare's' at all." How did this occur? The book is "that very doubtful 'canon.'" How, if "Shakespeare's" man edited it for "Shakespeare"? Did "Shakespeare" not care what stuff was placed under his immortal "*nom de plume*"?

It is not my fault if I think that Mr. Greenwood's hypotheses — the genuine "Shakespeare" either revised his own works, or put Ben on the editorial task — are absolutely contradicted by his statements in another part of his book. For the genuine "Shakespeare" knew what plays he had written, knew what he could honestly put forth as his own, as "Shakespeare's." Or, if he placed the task of editing in Ben's hands, he must have told Ben what plays were of his own making. In either case the Folio would contain these, and no others. But— "the *plat contraire*," — the very reverse, — is stated by Mr. Greenwood. "It stands admitted that a very large portion of that volume" (the Folio) "consists of work that is not 'Shakespeare's'" (is not Bacon's, or the other man's) "at all." Then away fly the hypotheses that the auto-Shakespeare, or that Ben, employed by the auto-Shakespeare (apparently Bacon) revised, edited, and prepared for publication the auto-Shakespearean plays. For Mr. Greenwood "has already dealt with *Titus* (*Andronicus*) and *Henry VI*," and proved them not to be auto-Shakespearean — and he adds "there are many other plays in that very doubtful

'canon'" (the Folio) "which, by universal admission, contain much non-Shakespearean composition." Perhaps! but if so the two hypotheses, that either the genuine Shakespeare revised ("is it not a more natural solution that 'Shakespeare' himself revised his works for publication, and that some part, at any rate, of this revision was done after 1616 and before 1623?"), or that he gave Ben (who was working, by the conjecture, for Bacon) the task of editing the Folio, — are annihilated. For neither the auto-Shakespeare (if honest), nor Ben (if sober), could have stuffed the Folio full of non-Shakespearean work, — including four "non-Shakespearean" plays, — nor could the Folio be "that very doubtful canon." Again, if either the auto-Shakespeare or Ben following his instructions, were Editor, neither could have, as the Folio Editor had "evidently no little doubt about" *Troilus and Cressida*.

Neither Ben, nor the actual Simon Pure, the author, the auto-Shakespeare, could fail to know the truth about *Trodus and Cressida*. But the Editor did *not* know the truth, the whole canon is "doubtful." Therefore the hypothesis, the "supposing," that the actual author did the revising, and the other hypothesis that he gave Ben the work, seem to me wholly impossible. But Mr. Greenwood needs the "supposings" of p, 293; and as he rejects *Titus Andronicus* and *Henry VI* (both in the Folio), he also needs the contradictory views of p, 358. On which set of supposings and averments does he stand to win?

Perhaps he thinks to find a way out of what appears to me to be a dilemma in the following fashion: He will not accept *Titus Andronicus* and *Henry VI*, though both are in the Folio, as the work of *his* "Shakespeare," his Unknown, the Bacon of the Baconians. Well, we ask, if your Unknown, or Bacon, or Ben, — instructed by Bacon, or by the Unknown, — edited the Folio, how could any one of the three insert *Titus*, and *Henry VI*, and be "in no little doubt about" *Troilus and Cressida*? Bacon, or the Unknown, or the Editor employed by either, knew perfectly well which plays either man could honestly claim as his own work, done under the "*nom de plume*" of "William Shakespeare" (with or without the hyphen). Yet the Editor of the Folio does not know — and Mr. Greenwood does know — *Henry VI* and *Titus* are "wrong ones."

Mr. Greenwood's way out, if I follow him, is this: "Judge Stotsenburg asks, 'Who wrote *The Taming of a Shrew* printed in 1594, and who wrote *Titus Andronicus*, *Henry VI*, or *King Lear* referred to in the Diary?'" (Henslowe's). The Judge continues: "Neither Collier nor any of the Shaxper commentators make (*sic*) any claim to their authorship in behalf of William Shaxper. Since these plays have the same names as those included in the Folio of 1623 the presumption is that they are the same plays until the contrary is shown. Of course it may be shown, either that those in the Folio are entirely different except in name, or that these plays were revised, improved, and dressed by some one whom they" (who?) "called Shakespeare."

Mr. Greenwood says, "My own conviction is that . . . these plays were 'revised, improved, and dressed by some one whom they called Shakespeare.'" (Whom *who* called Shakespeare?) In that case these plays, — say *Titus Andronicus* and *Henry VI*, Part 1, — which Mr. Greenwood denies to *his* "Shakespeare" were just as much *his* Shakespeare's plays as any other plays (and there are several), which *his* Shakespeare "revised, improved, and dressed." Yet *his* Shakespeare is *not* author of *Henry VI*, not the author of *Titus Andronicus*. "Mr. Anders," writes Mr. Greenwood, "makes what I think to be a great error in citing *Henry VI* and *Titus* as genuine plays of Shakespeare."

He hammers at this denial in nineteen references in his Index to *Titus Andronicus*. Yet Ben, or Bacon, or the Unknown thought that these plays *were* "genuine plays" of "Shakespeare," the concealed author — Bacon or Mr. Greenwood's man. It appears that the immense poet who used the "*nom de plume*" of "Shakespeare" did not know the plays of which he could rightfully call himself the author; that (not foreseeing Mr. Greenwood's constantly repeated objections) he boldly annexed four plays, or two certainly, which Mr. Greenwood denies to him, and another about which "the Folio Editor was in no little doubt."

Finally, Mr. Greenwood is "convinced," "it is my conviction" that some plays which he often denies to his "Shakespeare" were "revised, improved, and dressed by some one whom they called Shakespeare." That some one, if he

edited or caused to be edited the Folio, thought that his revision, improvement, and dressing up of the plays gave him a right to claim their authorship — and Mr. Greenwood, a dozen times and more, denies to him their authorship.

One is seriously puzzled to discover the critic's meaning. *The Taming of a Shrew*, *Titus*, *Henry VI*, and *King Lear*, referred to in Henslowe's "Diary," are not "Shakespearean," we are repeatedly told. But "my own conviction is that . . . " these plays were "revised, improved, and dressed by some one whom they called Shakespeare." But to be revised, improved, and dressed by some one whom they called Shakespeare, is to be as truly "Shakespearean" work as is any play so handled "by Shakespeare." Thus the plays mentioned are as truly "Shakespearean" as any others in which "Shakespeare" worked on an earlier canvas, and also *Titus* "is not *Shakespearean* at all." Mr. Greenwood, I repeat, constantly denies the "Shakespearean" character to *Titus* and *Henry VI*. "The conclusion of the whole matter is that *Titus* and *The Trilogy of Henry VI* are not the work of Shakespeare: that his hand is probably not to be found at all in *Titus*, and only once or twice, if at all, in *Henry VI*, Part I, but that he it probably was who altered and remodelled the two parts of the old *Contention of the Houses of York and Lancaster*, thereby producing *Henry VI*, Parts II and III."

Yet *Titus* and *Henry VI* appear as "revised, improved, and dressed" by the mysterious "some one whom they called Shakespeare." If Mr. Greenwood's conclusion be correct, "Shakespeare" had no right to place *Henry VI*, Part I, and *Titus* in his Folio. If his "conviction" be correct, Shakespeare had as good a right to them as to any of the plays which he revised, and improved, and dressed. They *must* be "Shakespearean" if Mr. Greenwood is right in his suggestion that "Shakespeare" either revised his works for publication between 1616 and 1623, or set his man, Ben Jonson, upon that business. Yet neither one nor the other knew what to make of *Troilus and Cressida*. "The Folio Editor had, evidently, no little doubt about that play."

So neither "Shakespeare" nor Ben, instructed by him, can have been "the Folio Editor." Consequently Mr. Greenwood must abandon his suggestion that either man was the Editor, and may return to his rejection of *Titus* and *Henry VI*,

Part I. But he clings to it. He finds in Henslowe's Diary "references to, and records of the writing of, such plays" as, among others, *Titus Andronicus*, and *Henry VI*.

Mr. Greenwood, after rejecting a theory of some one, says, "Far more likely does it appear that there was a great man of the time whose genius was capable of 'transforming dross into gold,' who took these plays, and, in great part, rewrote and revised them, leaving sometimes more, and sometimes less of the original work; and that so rewritten, revised, and transformed they appeared as the plays of 'Shakespeare.'"

This statement is made about "these plays," including *Titus Andronicus* and *Henry VI*, while "*Titus* and the *Trilogy of Henry VI* are not the work of Shakespeare . . . his hand is probably not to be found at all in *Titus*, and only once or twice in *Henry VI*, Part I," though he probably made Parts II and III out of older plays.

I do not know where to have the critic. If *Henry VI*, Part I, and *Titus* are in no sense by "Shakespeare," then neither "Shakespeare" nor Ben for him edited or had anything to do with the editing of the Folio. If either or both had to do with the editing, as the critic suggests, then he is wrong in denying Shakespearean origin to *Titus* and *Henry VI*, Part I.

Of course one sees a way out of the dilemma for the great auto-Shakespeare himself, who, by one hypothesis, handed over the editing of his plays to Ben (*he*, by Mr. Greenwood's "supposing," was deviling at literary jobs for Bacon). The auto-Shakespeare merely tells Ben to edit his plays, and never even gives him a list of them. Then Ben brings him the Folio, and the author looks at the list of Plays.

"Mr. Jonson," he says, "I have hitherto held thee for an honest scholar and a deserving man in the quality thou dost profess. But thou hast brought me a maimed and deformed printed copy of that which I did write for my own recreation, not wishful to be known for so light a thing as a poet. Moreover, thou hast placed among these my trifles, four plays to which I never put a finger, and others in which I had no more than a thumb. The Seneschal, Mr. Jonson,

will pay thee what is due to thee; thy fardels shall be sent whithersoever thou wilt, and, Mary! Mr. Jonson, I bid thee never more be officer of mine."

This painful discourse must have been held at Gorhambury, — if Ben edited the Folio — for Francis.

It is manifest, I hope, that about the Folio Mr. Greenwood speaks with two voices, and these very discordant. It is also manifest that, whoever wrote the plays left his materials in deep neglect, and that, when they were collected, some one gathered them up in extreme disorder. It is extraordinary that the Baconians and Mr. Greenwood do not see the fallacy of their own reasoning in this matter of the Folio. They constantly ridicule the old view that the actor, Will Shakspere (if, by miracle, he were the author of the plays), could have left them to take their fortunes. They are asked, what did other playwrights do in that age? They often parted with their whole copyright to the actors of this or that company, or to Henslowe. The new owners could alter the plays at will, and were notoriously anxious to keep them out of print, lest other companies should act them. As Mr. Greenwood writes, "Such, we are told, was the universal custom with dramatists of the day; they 'kept no copies' of their plays, and thought no more about them. It will, I suppose, be set down to fanaticism that I should doubt the truth of this proposition, that I doubt if it be consonant with the known facts of human nature." But whom, except Jonson, does Mr. Greenwood find editing and publishing his plays? Beaumont, Fletcher, Heywood? No!

If the Great Unknown were dead in 1623, his negligence was as bad as Will's. If he were alive and revised his own work for publication, he did it as the office cat might have done it in hours of play. If, on the other side, he handed the editorial task over to Ben, then he did not even give Ben a list of his genuine works. Mr. Greenwood cites the case of Ben Jonson, a notorious and, I think, solitary exception. Ben was and often proclaimed himself to be essentially a scholar. He took as much pains in prefacing, editing, and annotating his plays, as he would have taken had the texts been those of Greek tragedians.

Finally, all Baconians cry out against the sottish behaviour of the actor, Will, if being really the author of the plays, he did not bestir himself, and bring them out in a collected edition. Yet no English dramatist ventured on doing such a thing, till Ben thus collected his "works" (and was laughed at) in 1616. The example might have encouraged Will to be up and doing, but he died early in 1616. If Will were *not* the author, what care was Bacon, or the Unknown, taking of his many manuscript plays, and for the proper editing of those which had appeared separately in pamphlets? As indolent and casual as Will, the great Author, Bacon or another, left the plays to take their chances. Mr. Greenwood says that "*if the author*" (Bacon or somebody very like him) "*had been careless about keeping copies of his manuscripts* . . . " What an "if" in the case of the great Author! This gross neglect, infamous in Will, may thus have been practised by the Great Unknown himself.

In 1911 Mr. Greenwood writes, "There is overwhelming authority for the view that *Titus Andronicus* is not *Shakespearean* at all." In that case, neither Bacon, nor the Unknown, nor Ben, acting for either, can have been the person who put *Titus* into the Folio.

XII. BEN JONSON AND SHAKESPEARE

The evidence of Ben Jonson to the identity of Shakespeare the author with Shakspere the actor, is "the strength of the Stratfordian faith," says Mr. Greenwood. "But I think it will be admitted that the various Jonsonian utterances with regard to 'Shakespeare' are by no means easy to reconcile one with the other."

It is difficult to reply briefly to Mr. Greenwood's forty-seven pages about the evidence of Jonson. But, first, whenever in written words or in reported conversation, Ben speaks of Shakespeare by name, he speaks of his *works*: in 1619 to Drummond of Hawthornden; in 1623 in commendatory verses to the Folio; while, about 1630, probably, in his posthumously published *Discourses*, he writes on Shakespeare as the friend and "fellow" of the players, on Shakespeare as his own friend, and as a dramatist. On each of these three occasions, Ben's *tone* varies. In 1619 he said no more to Drummond of Hawthornden (apparently on two separate occasions) than that Shakespeare "lacked art," and made the mistake about a wreck on the sea-coast of Bohemia.

In 1619, Ben spoke gruffly and briefly of Shakespeare, as to Drummond he also spoke disparagingly of Beaumont, whom he had panegyrised in an epigram in his own folio of 1616, and was again to praise in the commendatory verses in the Folio. He spoke still more harshly of Drayton, whom in 1616 he had compared to Homer, Virgil, Theocritus, and Tyræus! He told an unkind anecdote of Marston, with whom he had first quarrelled and then made friends, collaborating with him in a play; and very generously and to his great peril, sharing his imprisonment. To Drummond, Jonson merely said that he "beat Marston and took away his pistol." Of Sir John Beaumont, brother of the dramatist, Ben had written a most hyperbolical eulogy in verse; luckily for Sir John, to Drummond Ben did not speak of him. Such was Ben, in panegyric verse hyperbolical; in conversation "a despiser of others, and praiser of himself." Compare Ben's three remarks about Donne, all made to Drummond.

Donne deserved hanging for breaking metre; Donne would perish for not being understood: and Donne was in some points the first of living poets.

Mr. Greenwood's effort to disable Jonson's evidence rests on the contradictions in his estimates of Shakespeare's poetry, in notices scattered through some thirty years. Jonson, it is argued, cannot on each occasion mean Will. He must now mean Will, now the Great Unknown, and now — both at once. Yet I have proved that Ben was the least consistent of critics, all depended on the occasion, and on his humour at the moment. This is a commonplace of literary history. The Baconians do not know it; Mr. Greenwood, if he knows it, ignores it, and bases his argument on facts which may be unknown to his readers. We have noted Ben's words of 1619, and touched on his panegyric of 1623. Thirdly, about 1630 probably, Ben wrote in his manuscript book *Discourses* an affectionate but critical page on Shakespeare as a man and an author. Always, in prose, and in verse, and in recorded conversation, Ben explicitly identified Shakspere (William, of Stratford) with the author of the plays usually ascribed to him. But the Baconian Judge Webb (in extreme old age), and the anti-Shakespearean Mr. Greenwood and others, choose to interpret Ben's words on the theory that, in 1623, he "had his tongue in his cheek"; that, like Odysseus, he "mingled things false with true," that *they* know what is true from what is false, and can undo the many knots which Ben tied in his tongue. How they succeed we shall see.

In addition to his three known mentions of Shakespeare by name (1619, 1623, 1630?), Ben certainly appears to satirise his rival at a much earlier date; especially as Pantalabus, a playwright in *The Poetaster* (1601), and as actor, poet, and plagiarist in an epigram, *Poet-Ape*, published in his collected works of 1616; but probably written as early as 1602. It is well known that in 1598 Shakespeare's company acted Ben's *Every Man in His Humour*. It appears that he conceived some grudge against the actors, and apparently against Shakespeare and other playwrights, for, in 1601, his *Poetaster* is a satire both on playwrights and on actors, whom he calls "apes." The apparent attacks on Shakespeare are just such as Ben, if angry and envious, would direct against

him; while we know of no other poet-player of the period to whom they could apply. For example, in *The Poetaster*, Histrio, the actor, is advised to ingratiate himself with *Pantalabus*, "gent'man parcel-poet, his father was a man of worship, I tell thee." This is perhaps unmistakably a blow at Shakespeare, who had recently acquired for his father and himself arms, and the pleasure of writing himself "gentleman." This "parcel-poet gent'man" "pens lofty, in a new stalking style," — he is thus an author, he "pens," and in a high style. He is called *Pantalabus*, from the Greek words for "to *take up all*," which means that, as poet, he is a plagiarist. Jonson repeats this charge in his verses called *Poet-Ape* —

"*He takes up all*, makes each man's wit his own,
And told of this, he slights it."

In a scene added to *The Poetaster* in 1616, the author (Ben) is advised not

"With a sad and serious verse to wound
Pantalabus, railing in his saucy jests,"

and obviously slighting the charges of plagiarism. Perhaps Ben is glancing at Shakespeare, who, if accused of plagiary by an angry rival, would merely laugh.

A reply to the *Poetaster*, namely *Satiromastix* (by Dekker and Marston?), introduces Jonson himself as babbling darkly about "Mr. Justice Shallow," and "an Innocent Moor" (Othello?). Here is question of "administering strong pills" to Jonson; *then*,

"What lumps of hard and indigested stuff,
Of bitter *Satirism*, of *Arrogance*,
Of *Self-love*, of *Detraction*, of a black
And stinking *Insolence* should we fetch up!"

This “pill” is a reply to Ben’s “purge” for the poets in his *Poetaster*. Oh, the sad old stuff!

Referring to Jonson’s *Poetaster*, and to *Satiromastix*, the counter-attack, we find a passage in the Cambridge play, *The Return from Parnassus* (about 1602). Burbage, the tragic actor, and Kempe, the low-comedy man of Shakespeare’s company, are introduced, discussing the possible merits of Cambridge wits as playwrights. Kempe rejects them as they “smell too much of that writer Ovid, and that writer Metamorphosis . . . “ The purpose, of course, is to laugh at the ignorance of the low-comedy man, who thinks “Metamorphosis” a writer, and does not suspect — how should he? — that Shakespeare “smells of Ovid.” Kempe innocently goes on, “Why, here’s our fellow” (comrade) “Shakespeare puts them all down” (all the University playwrights), “aye, and Ben Jonson too. O that Ben Jonson is a pestilent fellow, he brought up Horace” (in *The Poetaster*) “giving the poets a pill, but our fellow Shakespeare hath given him a purge . . .”

The Cambridge author, perhaps, is thinking of the pill (not purge) which, in *Satiromastix*, might be administered to Jonson. The Cambridge author may have thought that Shakespeare wrote the passage on the pill which was to “fetch up” masses of Ben’s insolence, self-love, arrogance, and detraction. If this be not the sequence of ideas, it is not easy to understand how or why Kempe is made to say that Shakespeare has given Jonson a purge. Stupid old nonsense! There are other more or less obscure indications of Jonson’s spite, during the stage-quarrel, against Shakespeare, but the most unmistakable proof lies in his verses in “Poet-Ape.” I am aware that Ben’s intention here to hit at Shakespeare has been denied, for example by Mr. Collins with his usual vigour of language. But though I would fain agree with him, the object of attack can be no known person save Will. Jonson was already, in *The Poetaster*, using the term “*Poet-Ape*,” for he calls the actors at large “apes.”

Jonson thought so well of his rhymes that he included them in the Epigrams of his first Folio (1616). By that date, the year of Shakespeare’s death, if he really loved Shakespeare, as he says, in verse and prose, Ben might have

suppressed the verses. But (as Drummond noted) he preferred his jest, such as it was, to his friend; who was not, as usually understood, a man apt to resent a very blunt shaft of very obsolete wit. Like Molière, Shakespeare had outlived the charge of plagiarism, made long ago by the jealous Ben.

Poet-Ape is an actor-playwright "*that would be thought our chief*" — words which, by 1601, could only apply to Shakespeare; there was no rival, save Ben, near his throne. The playwright-actor, too, has now confessedly

"grown
To a little wealth and credit in the scene,"

of no other actor-playwright could this be said.

He is the author of "works" (Jonson was laughed at for calling his own plays "works"), but these works are "the frippery of wit," that is, a tissue of plagiarisms, as in the case of *Pantalabus*. But "told of this he slights it," as most successful authors, when accused, as they often are, of plagiarism by jealous rivals, wisely do; — so did Molière. This Poet-Ape began his career by "picking and gleaning" and "buying reversions of old plays." This means that Shakespeare *did* work over earlier plays which his company had acquired; or, if Shakespeare did not, — then, I presume, — Bacon did!

That, with much bad humour, is the gist of the rhymes on Poet-Ape. Ben thinks Shakespeare's "works" very larcenous, but still, the "works," as such, are those of the poet-actor. I hope it is now clear that Poet-Ape, who, like *Pantalabus*, "takes up all"; who has "grown to a little wealth and credit in the scene," and who "thinks himself the chief" of contemporary dramatists, can be nobody but Shakespeare. Hence it follows that the "works" of Poet-Ape, are the works of Shakespeare. Ben admits, nay, asserts the existence of the works, says that they may reach "the after-time," but he calls them a mass of plagiarisms, — because he is in a jealous rage.

But this view does not at all suit Mr. Greenwood, for it shows Ben regarding Shakespeare as the "Ape," or Actor, and also as the "Poet" and author of the

"works." Yet Ben's words mean nothing if not that an actor is the author of works which Ben accuses of plagiarism. Mr. Greenwood thinks that the epigram proves merely that "Jonson looked upon Shakspere (if, indeed, he refers to him) as one who put forward the writings of others as his own, or, in plain English, an impostor." "The work which goes in his name is, in truth, the work of somebody else." Mr. Greenwood put the same interpretation on Greene's words about "Shakescene," and we showed that the interpretation was impossible. "The utmost we should be entitled to say" (if Shakescene be meant for Shakspere) "is that Greene accuses Player Shakspere of putting forward, as his own, some work or perhaps some parts of a work, for which he was really indebted to another." We proved, by quoting Greene's words, that he said nothing which could be tortured into this sense. In the same way Ben's words cannot be tortured into the sense that "the work which goes in his" (Poet-Ape's) "name is, in truth, the work of somebody else." Mr. Greenwood tries to find the Anti-Willian hypothesis in Greene's *Groatsworth of Wit* and in Ben's epigram. It is in neither.

Jonson is not accusing Shakespeare of pretending to be the author of plays written by somebody else, but of "making *each man's* wit his own," and the *men* are the other dramatists of the day. Thus the future "may judge" Shakespeare's work "to be his as well as *ours*."

It is "we," the living and recognised dramatists, whom Shakespeare is said to plagiarise from; so boldly that

"*We*, *the robbed*, leave rage, and pity it."

Ben does not mean that Shakespeare is publishing, as his own, whole plays by some other author, but that his works are tissues of scraps stolen from his contemporaries, from "us, the robbed." Where are to be found or heard of any works by a player-poet of 1601, the would-be chief dramatist of the day, except those signed William Shak(&c.). There are none, and thus Ben, at this date, is identifying Will Shakspere, the actor, with the author of the Shakespearean plays, which he expects to reach posterity; "after times may judge them to be his," as after times do to this hour.

Thus Ben expresses, in accordance with his humour on each occasion, most discrepant opinions of Will's works, but he never varies from his identification of Will with the author of the plays.

The "works" of which Ben wrote so splenetically in *Poet-Ape*, were the works of a Playwright-Actor, who could be nobody but the actor Shakespeare, as far as Ben then knew. If later, and in altered circumstances, he wrote of the very same works in very different terms, his "utterances" are "not easily reconcilable" with each other, — *whoever* the real author of the works may be. If Bacon, or Mr. Greenwood's anonymous equivalent for Bacon, were the author, and if Ben came to know it, his attitudes towards the *works* are still as irreconcilable as ever.

Perhaps Baconians and Mr. Greenwood might say, "as long as Ben believed that the works were those of an Actor-Playwright, he thought them execrable. But when he learned that they were the works of Bacon (or of some Great One), he declared them to be more than excellent" — *but not to Drummond*. I am reluctant to think that Jonson was the falsest and meanest of snobs. I think that when his old rival, by his own account his dear friend, was dead, and when (1623) Ben was writing panegyric verses about the first collected edition of his plays (the Folio), then between generosity and his habitual hyperbolical manner when he was composing commendatory verses, he said, — not too much in the way of praise, — but a good deal more than he later said (1630?), in prose, and in cold blood. I am only taking Ben as I find him and as I understand him. Every step in my argument rests on well-known facts. Ben notoriously, in his many panegyric verses, wrote in a style of inflated praise. In conversation with Drummond he censured, in brief blunt phrases, the men whom, in verse, he had extolled. The Baconian who has not read all Ben's panegyrics in verse, and the whole of his conversations with Drummond, argues in ignorance.

We now come to Ben's panegyrics in the Folio of 1623. Ben heads the lines,

"TO THE MEMORY OF MY BELOVED
THE AUTHOR
MR. WILLIAM SHAKESPEARE

MR. WILLIAM SHAKESPEARE
AND
WHAT HE HATH LEFT US."

Words cannot be more explicit. Bacon was alive (I do not know when Mr. Greenwood's hidden genius died), and Ben goes on to speak of the Author, Shakespeare, as dead, and buried. He calls on him thus:

"Soul of the Age!
The applause! delight! the wonder of our Stage!
My Shakespear rise: I will not lodge thee by
Chaucer, or Spenser, or bid Beaumont lie
A little further, to make thee a room:
Thou art a monument, without a tomb,
And art alive still, while thy book doth live,
And we have wits to read, and praise to give."

Beaumont, by the way, died in the same year as Shakespeare, 1616, and, while Ben here names him with Chaucer, Spenser, and Shakespeare, his contemporaries have left no anecdotes, no biographical hints. In the panegyric follow the lines:

"And though thou hadst small Latin and less Greek,
From thence to honour thee I would not seek
For names, but call forth thund'ring Æschylus,"

and the other glories of the Roman and Attic stage, to see and hear how Shakespeare bore comparison with all that the classic dramatists did, or that "did from their ashes come."

Jonson means, "despite your lack of Greek and Latin I would not shrink from challenging the greatest Greek and Roman tragedians to see how you bear comparison with themselves"?

Mr. Greenwood and the Baconians believe that the author of the plays abounded in Latin and Greek. In my opinion his classical scholarship must have seemed slight indeed to Ben, so learned and so vain of his learning: but this is part of a vexed question, already examined. So far, Ben's verses have brought not a hint to suggest that he does not identify the actor, his Beloved, with the author. Nothing is gained when Ben, in commendatory verses, praises "Thy Art," whereas, speaking to Drummond of Hawthornden (1619), he said that Shakespeare "wanted art." Ben is not now growling to Drummond of Hawthornden: he is writing a panegyric, and applauds Shakespeare's "well-turned and true-filed lines," adding that, "to write a living line" a man "must sweat," and "strike the second heat upon the Muses' anvil."

To produce such lines requires labour, requires conscious "art." So Shakespeare *had* "art," after all, despite what Ben had said to Drummond: "Shakespeare lacked art." There is no more in the matter; the "inconsistency" is that of Ben's humours on two perfectly different occasions, now grumbling to Drummond; and now writing hyperbolically in commendatory verses. But the contrast makes Mr. Greenwood exclaim, "Can anything be more astonishing and at the same time more unsatisfactory than this?"

Can anything be more like Ben Jonson?

Did he know the secret of the authorship in 1619? If so, why did he say nothing about the plays of the Great Unknown (whom he called Shakespeare), save what Drummond reports, "want of art," ignorance of Bohemian geography. Or did Ben *not* know the secret till, say, 1623, and then heap on the very works which he had previously scouted praise for the very quality which he had said they lacked? If so, Ben was as absolutely inconsistent, as before. There is no way out of this dilemma. On neither choice are Ben's utterances "easy to reconcile one with the other," except on the ground that Ben was — Ben, and his comments varied with his varying humours and occasions. I believe that, in the commendatory verses, Ben allowed his Muse to carry him up to heights of hyperbolical praise which he never came near in cold blood. He was warmed

with the heat of poetic composition and wound up to heights of eulogy, though even *now* he could not forget the small Latin and less Greek!

We now turn to Mr. Greenwood's views about the commendatory verses. On mature consideration I say nothing of his remarks on Ben's couplets about the bad engraved portrait. They are concerned with the supposed "*original* bust," as represented in Dugdale's engraving of 1656. What the Baconians hope to make out of "the *original* bust" I am quite unable to understand. Again, I leave untouched some witticisms on Jonson's lines about Spenser, Chaucer, and Beaumont in their tombs — lines either suggested by, or suggestive of others by an uncertain W. Basse, "but the evidence of authorship seems somewhat doubtful. How the date is determined I do not know . . . " As Mr. Greenwood knows so little, and as the discussion merely adds dust to the dust, and fog to the mist of his attempt to disable Ben's evidence, I glance and pass by.

"Then follow these memorable words, which I have already discussed:

"'And though thou hadst small Latin and less Greek . . . '"

In "these memorable words," every non-Baconian sees Ben's opinion about his friend's lack of scholarship. According to his own excellent Index, Mr. Greenwood has already adverted often to "these memorable words."

(1) P. 40. " . . . if this testimony is to be explained away as not seriously written, then are we justified in applying the same methods of interpretation to Jonson's other utterances as published in the Folio of 1623. But I shall have more to say as to that further on."

(2) P. 88. Nothing of importance.

(3) P. 220. Quotation from Dr. Johnson. Ben, "who had no imaginable temptation to falsehood," wrote the memorable words. But Mr. Greenwood has to imagine a "temptation to falsehood," — and he does.

(4) P. 222. "And we have recognised that Jonson's 'small Latin and less Greek' must be explained away" (a quotation from somebody).

(5) P. 225. Allusion to anecdote of "Latin (latten) spoons."

(6) P, 383. "Some of us" (some of whom?) "have long looked upon it as axiomatic . . . that Jonson's 'small Latin and less Greek,' if meant to be taken

seriously, can only be applicable to Shakspere of Stratford and not to Shakespeare," that is, not to the Unknown author. Unluckily Ben, in 1623, is addressing the shade of the "sweet Swan of Avon," meaning Stratford-on-Avon.

(7) The next references in the laudable Index are to p, 475. "Then follow these memorable words, which I have already discussed:

"'And though thou hadst small Latin and less Greek,'

words which those who see how singularly inappropriate they are to the author of the *Plays* and *Poems* of Shakespeare have been at such infinite pains to explain away without impeaching the credit of the author, or assuming that he is here indulging in a little Socratic irony."

I do not want to "explain" Ben's words "away": I want to know how on earth Mr. Greenwood explains them away. My view is that Ben meant what he said, that Will, whose shade he is addressing, was no scholar (which he assuredly was not). I diligently search Mr. Greenwood's scriptures, asking How does he explain Ben's "memorable words" away? On of *The Shakespeare Problem Restated* I seem to catch a glimmer of his method. "Once let the Stratfordians" (every human and non-Baconian person of education) "admit that Jonson when he penned the words 'small Latin and less Greek' was really writing 'with his tongue in his cheek.' . . ."

Once admit that vulgarism concerning a great English poet engaged on a poem of Pindaric flight, and of prophetic vision! No, we leave the admission to Mr. Greenwood and his allies.

To consider thus is to consider too seriously. The Baconians and Anti-Willians have ceased to deserve serious attention (if ever they did deserve it), and virtuous indignation, and all that kind of thing, when they ask people who care for poetry to "admit" that Ben wrote his verses "with his tongue in his cheek." Elsewhere, in place of Ben's "tongue in his cheek," Mr. Greenwood prefers to suggest that Ben "is here indulging in a little Socratic irony." Socrates "with his tongue in his cheek"! Say "talking through his throat," if one may accept the evidence of the author of *Raffles*, as to the idioms of burglars.

To return to criticism, we are to admit that Jonson was really writing "with his tongue in his cheek," knowing that, as a fact, "*Shakespeare*" (the Great Unknown, the Bacon of the Baconians) "had remarkable classical attainments, and they, of course, open the door to the suggestion that the entire poem is capable of an ironical construction and esoteric interpretation."

So this is Mr. Greenwood's method of "explaining away" the memorable words. He seems to conjecture that Will was not *Shakespeare*, not the author of the plays; that Jonson knew it; that his poem is, as a whole, addressed to Bacon, or to the Great Unknown, under his "*nom de plume*" of "William Shakespeare"; that the address to the "Swan of Avon" is a mere blind; and that Ben only alludes to his "Beloved," the Stratford actor, when he tells his Beloved that his Beloved has "small Latin and less Greek." All the praise is for Bacon, or the Great Unknown (Mr. Harris), the jeer is for "his Beloved, the Author, Mr. William Shakespeare, And what he hath left Us."

As far as I presume to understand this theory of the "tongue in the cheek," of the "Socratic irony," this is what Mr. Greenwood has to propose towards "explaining away" the evidence of Ben Jonson, in his famous commendatory verses. When we can see through the dust of words we find that the "esoteric interpretation" of the commendatory verses is merely a reassertion of the general theory: a man with small Latin and less Greek could not have written the plays and poems. Therefore when Ben explicitly states that his Beloved, Mr. Shakespeare of Stratford, the Swan of Avon *did* write the plays, and had small Latin and less Greek, Ben meant that he did *not* write them, that they were written by somebody else who had plenty of Greek and Latin. It is a strange logical method! Mr. Greenwood merely reasserts his paradox, and proves it, like certain Biblical critics of more orthodoxy than sense, by aid of his private "esoteric method of interpretation." Ben, we say, about 1630, in prose and in cold blood, and in a humour of criticism without the old rancour and envy, or the transitory poetic enthusiasm, pens a note on Shakespeare in a volume styled "Timber, or Discoveries, made upon men and Matter, as they have flowed out of his daily Readings; or had their reflux to his peculiar Notion of the Times." Ben

died in 1637; his MS. collection of notes and brief essays, and reflections, was published in 1641. Bacon, of whom he wrote his impressions in this manuscript, had died in 1626. Ben was no longer young: he says, among these notes, that his memory, once unusually strong, after he was past forty "is much decayed in me . . . It was wont to be faithful to me, but shaken with age now . . ." (I copy the extract as given by Mr. Greenwood.) He spoke sooth: he attributes to Orpheus, in "Timber," a line from Homer, and quotes from Homer what is not in that poet's "works."

In this manuscript occurs, then, a brief prose note, headed, *De Shakespeare nostrati*, on our countryman Shakespeare. It is an anecdote of the Players and their ignorance, with a few critical and personal remarks on Shakespeare. "I remember the players have often mentioned it as an honour to Shakespeare that (whatsoever he penned) he never blotted out a line. My answer hath been, 'Would he had blotted a thousand,' which they thought a malevolent speech. I had not told posterity this but for their ignorance who chose that circumstance to commend their friend by (that) wherein he most faulted; and to justify mine own candour, for I loved the man, and do honour his memory on this side idolatry as much as any. He was, indeed, honest, and of an open and free nature; had an excellent phantasy, brave notions and gentle expressions, wherein he flowed with that facility that sometimes it was necessary he should be stopped. '*Sufflaminandus erat*,' as Augustus said of Haterius. His wit was in his own power; would the rule of it had been so too! Many times he fell into those things could not escape laughter, as when he said in the person of Cæsar, one speaking to him, 'Cæsar, thou dost me wrong.' He replied, 'Cæsar did never wrong but with just cause'; and such like, which were ridiculous. But he redeemed his vices with his virtues. There was ever more in him to be praised than to be pardoned." Baconians actually maintain that Ben is here speaking of Bacon.

Of whom is Ben writing? Of the author of *Julius Cæsar*, — certainly, from which, his memory failing, he misquotes a line. If Ben be in the great secret — that the author was Bacon, or Mr. Greenwood's Great Unknown, he is here no more enthusiastic about the Shadow or the Statesman, than about Shakespeare;

no less cool and critical, whoever may be the subject of his comments. Whether, in the commendatory verses, he referred to the Actor-Author, or Bacon, or the Shining Shadow, or all of them at once, he is now in a mood very much more cool and critical. If to be so cool and critical is violently inconsistent in the case of the Stratford actor, it is not less so if Ben has Bacon or the Shadow in his mind. Meanwhile the person of whom he speaks *is here the actor-author*, whom the players, his friends, commended "wherein he faulted," namely, in not "blotting" where, in a thousand cases, Ben wishes that he *had* blotted. Can the most enthusiastic Baconian believe that when Ben wrote about the players' ignorant applause of Shakespeare's, of their friend's lack of care in correction, Ben had Bacon in his mind?

As for Mr. Greenwood, he says that in Ben's sentence about the players and their ignorant commendation, "we have it on Jonson's testimony that the players looked upon William Shakspere the actor as the author of the plays and praised him for never blotting out a line." We have it, and how is the critic to get over or round the fact? Thus, "We know that this statement" (about the almost blotless lines) "is ridiculous; that if the players had any unblotted manuscripts in their hands (which is by no means probable) they were merely fair copies . . ."

Perhaps, but the Baconians appear to assume that a "fair copy" is not, and cannot be, a copy in the handwriting of the author.

As I have said before, the Players knew Will's handwriting, if he could write. If they received his copy in a hand not his own, and were not idiots, they could not praise him and his unerring speed and accuracy in penning his thoughts. If, on the other hand, Will could not write, in their long friendship with Will, the Players must have known the fact, and could not possibly believe, as they certainly did, "on Jonson's testimony" in his authorship.

To finish Mr. Greenwood's observations, "if they" (the players) "really thought that the author of the plays wrote them off *currente calamo*, and never" (or "hardly ever") "blotted a line, never revised, never made any alterations, they knew nothing whatever concerning the real Shakespeare."

Nothing whatever? What they did not know was merely that Will gave them fair copies in his own hand, as, before the typewriting machine was invented, authors were wont to do. Within the last fortnight I heard the error attributed to the players made by an English scholar who is foremost in his own field of learning. He and I were looking at some of Dickens's MSS. They were full of erasions and corrections. I said, "How unlike Scott!" whose first draft of his novels exactly answered to the players' description of Will's "copy." My friend said, "Browning scarcely made an erasion or change in writing his poems," and referred to Mr. Browning's MSS. for the press, of which examples were lying near us. "But Browning must have made clean copies for the press," I said: which was as new an idea to my learned friend as it was undreamed of by the Players: — if what they received from him were his clean copies.

The Players' testimony, through Jonson, cannot be destroyed by the "easy stratagem" of Mr. Greenwood.

Mr. Greenwood now nearly falls back on Bacon, though he constantly professes that he "is not the advocate of Bacon's authorship." The author was some great man, as like Bacon as one pea to another. Mr. Greenwood says that Jonson looked on the issue of the First Folio "as a very special occasion." Well, it *was* a very special occasion; no literary occasion could be more "special." Without the Folio, badly as it is executed, we should perhaps never have had many of Shakespeare's plays. The occasion was special in the highest degree.

But, says Mr. Greenwood, "if we could only get to the back of Jonson's mind, we should find that there was some efficient cause operating to induce him to give the best possible sendoff to that celebrated venture."

Ben was much in the habit of giving "sendoffs" of great eloquence to poetic "ventures" now forgotten. What could "the efficient cause" be in the case of the Folio? At once Mr. Greenwood has recourse to Bacon; he cannot, do what he will, keep Bacon "out of the Memorial." Ben was with Bacon at Gorhambury, on Bacon's sixtieth birthday (January 22, 1621). Ben wrote verses about the Genius of the old house,

"Thou stand'st as if some mystery thou didst."

"What was that 'mystery'?" asks Mr. Greenwood. What indeed? And what has all this to do with Ben's commendatory verses for the Folio, two years later? Mr. Greenwood also surmises, as we have seen, that Jonson was with Bacon, helping to translate *The Advancement of Learning* in June, 1623.

Let us suppose that he was: what has that to do with Ben's verses for the Folio? Does Mr. Greenwood mean to hint that *Bacon* was the "efficient cause operating to induce" Ben "to give the best possible sendoff" to the Folio? One does not see what interest Bacon had in stimulating the enthusiasm of Ben, unless we accept Bacon as author of the plays, which Mr. Greenwood does not. If Mr. Greenwood thinks that Bacon was the author of the plays, then the facts are suitable to his belief. But if he does not,— "I hold no brief for the Baconians," he says, — how is all this passage on Ben's visits to Bacon concerned with the subject in hand?

Between the passage on some "efficient cause" "at the back of Ben's mind," and the passage on Ben's visits to Bacon in 1621–3, six pages intervene, and blur the supposed connection between the "efficient cause" of Ben's verses of 1623, and his visits to Bacon in 1621–3. These intercalary pages are concerned with Ben's laudations of Bacon, by name, in his *Discoveries*. The first is entirely confined to praise of Bacon as an orator. Bacon is next mentioned in a Catalogue of Writers as "*he who hath filled up all numbers*, and performed that in our tongue which may be preferred or compared either to *insolent Greece or haughty Rome*," words used of Shakespeare by Jonson in the Folio verses.

Mr. Greenwood remarks that Jonson's Catalogue, to judge by the names he cites (More, Chaloner, Smith, Sir Nicholas Bacon, Sidney, Hooker, Essex, Raleigh, Savile, Sandys, and so on), suggests that "he is thinking mainly of wits and orators of his own and the preceding generation," not of poets specially. This is obvious; why should Ben name Shakespeare with More, Smith, Chaloner, Eliot, Bishop Gardiner, Egerton, Sandys, and Savile? Yet "it is remarkable that no mention should be made of the great dramatist." Where is Spenser named, or Beaumont, or Chaucer, with whom Ben ranked Shakespeare? Ben quoted of Bacon the line he wrote long before of Shakespeare as a poet,

about “insolent Greece,” and all this is “remarkable,” and Mr. Greenwood finds it “not surprising” that the Baconians dwell on the “extraordinary coincidence of expression,” as if Ben were incapable of repeating a happy phrase from himself, and as if we should wonder at anything the Baconians may say or do.

Another startling coincidence is that, in *Discoveries*, Ben said of Shakespeare “his wit was in his own power,” and wished that “the rule of it had been so too.” Of Bacon, Ben wrote, “his language, where he could spare or pass by a jest, was nobly censorious.” Thus Bacon *had* “the rule of his own wit,” Bacon “*could* spare or pass by a jest,” whereas Shakespeare apparently could not — so like were the two Dromios in this particular! Strong in these convincing arguments, the Baconians ask (not so Mr. Greenwood, he is no Baconian), “were there then *two* writers of whom this description was appropriate . . . ?” Was there only one, and was it of Bacon, under the name of “Shakespeare,” that Ben wrote *De Shakespeare nostrati*?

Read it again, substituting “Bacon” for “Shakespeare.” “I remember the players,” and so on, and what has Bacon to do here? “Sometimes it was necessary that *Bacon* should be stopped.” “Many times *Bacon* fell into those things could not escape laughter,” such as Cæsar’s supposed line, “and such like, which were ridiculous.” “*Bacon* redeemed his vices with his virtues. There was ever more in *Bacon* to be praised than to be pardoned.”

Thus freely, according to the Baconians, speaks Ben of Bacon, whom he here styles “Shakespeare,” — Heaven knows why! while crediting him with the players as his friends. Ben could not think or speak thus of Bacon. Mr. Greenwood occupies his space with these sagacities of the Baconians; one marvels why he takes the trouble. We are asked why Ben wrote so little and that so cool (“I loved him on this side idolatry as much as any”) about Shakespeare. Read through Ben’s *Discoveries*: what has he to say about any one of his great contemporary dramatists, from Marlowe to Beaumont? He says nothing about any of them; though he had panegyrised them, as he panegyrised Beaumont, in verse. In his prose *Discoveries* he speaks, among English dramatists, of Shakespeare alone.

We are also asked by the Baconians to believe that his remarks on Bacon under the name of Shakespeare are really an addition to his more copious and infinitely more reverential observations on Bacon, named by his own name; "I have and do reverence him for the greatness that was only proper to himself." Also (where Bacon is spoken of as Shakespeare) "He redeemed his vices by his virtues. There was ever more in him to be praised than to be pardoned . . . Sometimes it was necessary that he should be stopped . . . Many times he fell into those things that could not escape laughter."

These two views of Bacon are, if you like, incongruous. The person spoken of is in both cases Bacon, say the Baconians, and Mr. Greenwood sympathetically alludes to their ideas, which I cannot qualify in courteous terms. Baconians "would, of course, explain the difficulty by saying that however sphinx-like were Jonson's utterances, he had clearly distinct in his own mind two different personages, *viz.* Shakspere the player, and Shakespeare the real author of the plays and poems, and that if in the perplexing passage quoted from the *Discoveries* he appears to confound one with the other, it is because the solemn seal of secrecy had been imposed on him." They *would* say, they *do* say all that. Ben is not to let out that Bacon is the author. So he tells us of Bacon that he often made himself ridiculous, and so forth, — but he *pretends* that he is speaking of Shakespeare.

All this wedge of wisdom, remember, is inserted between the search for "the efficient cause" of Ben's panegyric (1623), in the Folio, on his Beloved Mr. William Shakespeare, and the discovery of Ben's visits to Bacon in 1621–3.

Does Mr. Greenwood mean that Ben, in 1623 (or earlier), knew the secret of Bacon's authorship, and, stimulated by his hospitality, applauded his works in the Folio, while, as he must not disclose the secret, he throughout speaks of Bacon as Shakespeare, puns on that name in the line about seeming "to shake a lance," and salutes the Lord of Gorhambury as "Sweet Swan of Avon"? Mr. Greenwood cannot mean that; for he is not a Baconian. What *does* he mean?

Put together his pages 483, 489–491. On the former we find how "it would appear" that Jonson thought the issue of the Folio (1623) "a very special

occasion," and that perhaps if we could only "get to the back of his mind, we should find that there was some efficient cause operating to induce him to give the best possible sendoff to that celebrated venture." Then skip to p–491, and you find very special occasions: Bacon's birthday feast with its "mystery"; Ben as one of Bacon's "good pens," in 1623. "The best of these good pens, it seems, was Jonson." On what evidence does it "seem"? The opinion of Judge Webb.

Is this supposed collaboration with Bacon in 1623, "the efficient cause operating to induce" Ben "to give the best possible sendoff" to the Folio? How could this be the "efficient cause" if Bacon were not the author of the plays?

Mr. Greenwood, like the Genius at the birthday supper,

"Stands as if some mystery he did."

On a trifling point of honour, namely, as to whether Ben were a man likely to lie, tortuously, hypocritically, to be elaborately false about the authorship of the Shakespearean plays, it is hopelessly impossible to bring the Baconians and Mr. Greenwood (who "holds no brief for the Baconians") to my point of view. Mr. Greenwood rides off thus — what the Baconians do is unimportant.

"There are, as everybody knows, many falsehoods that are justifiable, some that it is actually a duty to tell." It may be so; I pray that I may never tell any of them (or any more of them).

Among justifiable lies I do not reckon that of Scott if ever he plumply denied that he wrote the *Waverley* novels. I do not judge Sir Walter. Heaven forbid! But if, in Mr. Greenwood's words, he, "we are told, thought it perfectly justifiable for a writer who wished to preserve his anonymity, to deny, when questioned, the authorship of a work, since the interrogator had no right to put such a question to him," I disagree with Sir Walter. Many other measures, in accordance with the conditions of each case, were open to him. Some are formulated by his own Bucklaw, in *The Bride of Lammermoor*, as regards questions about what occurred on his bridal night. Bucklaw would challenge the man, and cut the lady, who asked questions. But Scott's case, as cited, applies only to Bacon (or Mr. Greenwood's Unknown), if *he* were asked whether or not he were the author of the plays. No idiot, at that date, was likely to put the

question! But, if anyone did ask, Bacon must either evade, or deny, or tell the truth.

On the parallel of Scott, Bacon could thus deny, evade, or tell the truth. But the parallel of Scott is not applicable to any other person except to the author who wishes to preserve his anonymity, and is questioned. The parallel does not apply to Ben. *He* had not written the Shakespearean plays. Nobody was asking *him* if he had written them. If he knew that the author was Bacon, and knew it under pledge of secrecy, and was asked (*per impossibile*) "Who wrote these plays?" he had only to say, "Look at the title-page." But no mortal was asking Ben the question. But we are to suppose that, in the panegyric and in *Discoveries*, Ben chooses to assert, first, that Shakespeare was his Beloved, his Sweet Swan of Avon; and that he "loved him, on this side idolatry, as much as any." There is no evidence that he did love Shakespeare, except his own statement, when, according to the Baconians, he is really speaking of Bacon, and, according to Mr. Greenwood, of an unknown person, singularly like Bacon. Consequently, unless we can prove that Ben really loved the actor, he is telling a disgustingly hypocritical and wholly needless falsehood, both before and after the death of Bacon. To be silent about the authorship of a book, an authorship which is the secret of your friend and patron, is one thing and a blameless thing. All the friends, some twenty, to whom Scott confided the secret of his authorship were silent. But not one of them publicly averred that the author was their very dear friend, So-and-so, who was not Scott, and perhaps not their friend at all. That was Ben's line. Thus the parallel with Scott drawn by Mr. Greenwood, twice, is no parallel. It has no kind of analogy with Ben's alleged falsehoods, so elaborate, so incomprehensible except by Baconians, and, if he did not love the actor Shakspere dearly, so detestably hypocritical, and open to instant detection.

It is not easy to find a parallel to the conduct with which Ben is charged. But suppose that Scott lived unsuspected of writing his novels, which, let us say, he signed "James Hogg," and died without confessing his secret, and without taking his elaborate precautions for its preservation on record.

Next, imagine that Lockhart knew Scott's secret, under vow of silence, and was determined to keep it at any cost. He therefore, writing after the death of Hogg of Ettrick, and in Scott's lifetime, publishes verses declaring that Hogg was his "beloved" (an enormous fib), and that Hogg, "Sweet Swan of Ettrick," was the author of the *Waverley* novels.

To complete the parallels, Lockhart, after Scott's death, leaves a note in prose to the effect that, while he loved Hogg on this side idolatry (again, a monstrous fable), he must confess that Hogg, author of the *Waverley* novels, often fell into things that were ridiculous; and often needed to have a stopper put on him for all these remarks. Lockhart, while speaking of Hogg, is thinking of Scott — and he makes the remarks solely to conceal Scott's authorship of the novels — of which, on the hypothesis, nobody suspected Scott to be the author. Lockhart must then have been what the Baconian Mr. Theobald calls Mr. Churton Collins, "a measureless liar," — all for no reason.

Mr. Greenwood, starting as usual from the case, which is no parallel, of Scott's denying his own authorship, goes on, "for all we know, Jonson might have seen nothing in the least objectionable in the publication by some great personage of his dramatic works under a pseudonym" (under another man's name really), "even though that pseudonym led to a wrong conception as to the authorship; and that, if, being a friend of that great personage, and working in his service" (Ben worked, by the theory, in Bacon's), "he had solemnly engaged to preserve the secret inviolate, and not to reveal it even to posterity, then *doubtless* ('I thank thee, Jew' (meaning Sir Sidney Lee), 'for teaching me that word'!) he would have remained true to that solemn pledge."

To remain "true," Ben had only to hold his peace. But he lied up and down, and right and left, and even declared that Bacon was a friend of the players, and needed to be shut up, and made himself a laughing-stock in his plays, — styling Bacon "Shakespeare." All this, and much more of the same sort, we must steadfastly believe before we can be Baconians, for only by believing these doctrines can we get rid of Ben Jonson's testimony to the authorship of Will Shakspere, Gent.

XIII. THE PREOCCUPATIONS OF BACON

Let us now examine a miracle and mystery in which the Baconians find nothing strange; nothing that is not perfectly normal. Bacon was the author of the Shakespearean plays, they tell us. Let us look rapidly at his biography, after which we may ask, does not his poetic supremacy, and imaginative fertility, border on the miraculous, when we consider his occupations and his ruling passion?

Bacon, born in 1561, had a prodigious genius, was well aware of it, and had his own ideal as to the task which he was born to do. While still at Cambridge, and therefore before he was fifteen, he was utterly dissatisfied, as he himself informed Dr. Rawley, with the scientific doctrines of the Schools. In the study of nature they reasoned from certain accepted ideas, *a priori* principles, not from what he came to call "interrogation of Nature." There were, indeed, and had long been experimental philosophers, but the school doctors went not beyond Aristotle; and discovered nothing. As Mr. Spedding puts it, the boy Bacon asked himself, "If our study of nature be thus barren, our method of study must be wrong; might not a better method be found? . . . Upon the conviction 'This may be done,' followed at once the question, *How* may it be done? Upon that question answered followed the resolution to try and do it."

This was, in religious phrase, the Conversion of Bacon, "the event which had a greater influence than any other upon his character and future course. From that moment he had a vocation which employed and stimulated him . . . an object to live for as wide as humanity, as immortal as the human race; an idea to live in vast and lofty enough to fill the soul for ever with religious and heroic aspirations." The vocation, the idea, the object, were not poetical.

In addition to this ceaseless scientific preoccupation, Bacon was much concerned with the cause of reformed religion (then at stake in France, and supposed to be in danger at home), and with the good government of his native country. He could only aid that cause by the favour of Elizabeth and James; by

his services in Parliament, where, despite his desire for advancement, he conscientiously opposed the Queen. He was obliged to work at such tasks of various sorts, legal and polemical literature, as were set him by people in power. With these three great objects filling his heart, inspiring his ambition, and occupying his energies and time, we cannot easily believe, without direct external evidence, that he, or any mortal, could have leisure and detachment from his main objects (to which we may add his own advancement) sufficient to enable him to compose the works ascribed to Shakespeare.

Thus, at the age of twenty-two (1583), when, if ever, he might have penned sonnets to his mistress's eyebrow, he reports that he wrote "his first essay on the Instauration of Philosophy, which he called *Temporis Partus Maximus*, 'The Greatest Birth of Time,'" and "we need not doubt that between Law and Philosophy he found enough to do." For the Baconians take Bacon to have been a very great lawyer (of which I am no judge), and Law is a hard mistress, rapacious of a man's hours. In 1584 he entered Parliament, but we do not hear anything very important of his occupations before 1589, when he wrote a long pamphlet, "Touching the Controversies of the Church of England." He had then leisure enough; that he was not anonymously supplying the stage with plays I can neither prove nor disprove: but there is no proof that he wrote *Love's Labour's Lost*! By 1591–2, we learn much of him from his letter to Cecil, who never would give him a place wherein he could meditate his philosophy. He was apparently hard at scientific work. "I account my ordinary course of study and meditation to be more painful than most parts of action are." He adds, "The contemplative planet carries me away wholly," and by contemplation I conceive him to mean what he calls "vast contemplative ends." These he proceeds to describe: he does *not* mean the writing of *Venus and Adonis* (1593), nor of *Lucrece* (1594), nor of comedies! "I have taken all knowledge to be my province," and he recurs to his protest against the pseudo-science of his period. "If I could purge knowledge of two sorts of rovers whereof the one, with frivolous disputations, confutations, and verbosities; the other with blind experiments, and auricular traditions and impostures, hath committed so many

spoils, I hope I should bring in industrious observations, grounded conclusions, and profitable inventions and discoveries . . . This, whether it be curiosity, or vainglory, or nature, or (if one take it favourably) philanthropy, is so fixed in my mind that it cannot be removed." If Cecil cannot help him to a post, if he cannot serve the truth, he will reduce himself, like Anaxagoras, to voluntary poverty, " . . . and become some sorry bookmaker, or a true pioneer in that mine of truth . . . " Really, from first to last he was the prince of begging-letter writers, endlessly asking for place, pensions, reversions, money, and more money.

Though his years were thirty-one, Bacon was as young at heart as Shelley at eighteen, when he wrote thus to Cecil, "my Lord Treasurer Burghley." What did Cecil care for his youngish kinsman's philanthropy, and "vast speculative ends" (how *modern* it all is!), and the rest of it? But just because Bacon, at thirty-one, *is* so extremely "green," going to "take all knowledge for his province" (if some one will only subsidise him, and endow his research), I conceive that he was in earnest about his reformation of science. Surely no Baconian will deny it! Being so deeply in earnest, taking his "study and meditation" so hard, I cannot see him as the author of *Venus and Adonis*, and whatever plays of the period, — say, *Love's Labour's Lost*, *The Two Gentlemen of Verona*, *Henry VI*, Part I, — are attributed to him, about this time, by Baconians. Of course my view is merely personal or "subjective." The Baconians' view is also "subjective." I regard Bacon, in 1591, and later, as intellectually preoccupied by his vast speculative aims: — what he says that he desires to do, in science, is what he *did*, as far as he was able. His other desires, his personal advancement, money, a share in the conduct of affairs, he also hotly pursued, not much to his own or the public profit. There seems to be no room left, no inclination left, for competition in their own line with Marlowe, Greene, Nash, and half a dozen other professed playwrights: no room for plays done under the absurd pseudonym of an ignorant actor.

You see these things as the Baconians do, or as I do. Argument is unavailing. I take Bacon to have been sincere in his effusive letter to Cecil. Not so the Baconians; he concealed, they think, a vast *literary* aim. They must take

his alternative — to be "some sorry bookmaker, *or* a pioneer in that mine of truth," as meaning that he would either be the literary hack of a company of players, *or* the founder of a regenerating philosophy. But, at that date, playwrights could not well be called "bookmakers," for the owners of the plays did their best to keep them from appearing as printed books. If Bacon by "bookmaker" meant "playwright," he put a modest value on his poetical work!

Meanwhile (1591–2), Bacon attached himself to the young, beautiful, and famous Essex, on the way to be a Favourite, and gave him much excellent advice, as he always did, and, as always, his advice was not taken. It is not a novel suggestion, that Essex is the young man to whom Bacon is so passionately attached in the Sonnets traditionally attributed to Shakespeare. "I applied myself to him" (that is, to Essex), says Bacon, "in a manner which, I think, happeneth rarely among men." The poet of the Sonnets applies himself to the Beloved Youth, in a manner which (luckily) "happeneth rarely among men."

It is difficult to fit the Sonnets into Bacon's life. But, if you pursue the context of what Bacon says concerning Essex, you find that he does not speak *openly* of a tenderly passionate attachment to that young man; not more than *this*, "I did nothing but advise and ruminate with myself, to the best of my understanding, propositions and memorials of anything that might concern his Lordship's honour, fortune, or service." As Bacon did nothing but these things (1591–2), he had no great leisure for writing poetry and plays. Moreover, speaking as a poet, in the Sonnets, he might poetically exaggerate his intense amatory devotion to Essex into the symbolism of his passionate verse. *Was Essex then a married man*? If so, the Sonneteer's insistence on his marrying must be symbolical of — anything else you please.

We know that Bacon, at this period, "did nothing" but "ruminate" about Essex. The words are his own! (1604). No plays, no *Venus and Adonis*, nothing but enthusiastic service of Essex and the Sonnets. Mr. Spedding, indeed, thinks that, to adorn some pageant of Essex (November 17, 1592), Bacon kindly contributed such matter as "Mr. Bacon in Praise of Knowledge" (containing his

usual views about regenerating science), and "Mr. Bacon's Discourse in Praise of his Sovereign." Both are excellent, though, for a Court festival, not very gay.

He also, very early in 1593, wrote an answer to Father Parson's (?) famous indictment of Elizabeth's Government, in *Observations on a Libel*. What with ruminating on Essex, and this essay, he was not solely devoted to *Venus and Adonis* and to furbishing-up old plays, though, no doubt, he *may* have unpacked his bosom in the Sonnets, and indulged his luscious imaginations in *Venus and Adonis*. I would not limit the potentialities of his genius. But, certainly, this amazing man was busy in quite other matters than poetry; not to mention his severe "study and meditation" on science.

All these activities of Bacon, in the year of *Venus and Adonis*, do not exhaust his exercises. Bacon, living laborious days, plunged into the debate in the Commons on Supply and fell into Elizabeth's disgrace, and vainly competed with Coke for the Attorney-Generalship, and went on to write a pamphlet on the conspiracy of Lopez, and to try to gain the office of Solicitor-General, to manage Essex's affairs, to plead at the Bar, to do Crown work as a lawyer, to urge his suit for the Solicitorship; to trifle with the composition of "Formularies and Elegancies" (January 1595), to write his Essays, to try for the Mastership of the Rolls, to struggle with the affairs of the doomed Essex (1600–1), while always "labouring in secret" at that vast aim of the reorganisation of natural science, which ever preoccupied him, he says, and distracted his attention from his practice and from affairs of State. Of these State affairs the projected Union with Scotland was the most onerous. He was also writing *The Advancement of Learning* (1605). "I do confess," he wrote to Sir Thomas Bodley, "since I was of any understanding, my mind hath in effect been absent from that I have done." His mind was with his beloved Reformation of Learning: this came between him and his legal, his political labours, his pamphlet-writing, and his private schemes and suits. To this burden of Atlas the Baconians add the vamping-up of old plays for Shakespeare's company, and the inditing of new plays, poems, and the Sonnets. Even without this considerable addition to his tasks, Bacon is wonderful enough, but with it — he needs the sturdy faith of the

Rationalist to accept him and his plot — to write plays under the pseudonym of "William Shakespeare."

Talk of miracles as things which do not happen! The activities of Bacon from 1591 to 1605; the strain on that man's mind and heart, — especially his heart, when we remember that he had to prosecute his passionately adored Essex to the death; all this makes it seem, to me, improbable that, as Mrs. Pott and her school of Baconians hold, he lived to be at least a hundred and six, if not much older. No wonder that he turned to tragedy, *Lear*, *Macbeth*, *Othello*, and saw life *en noir*: man delighted him not, nor woman either.

The occupations, and, even more, the scientific preoccupation of Bacon, do not make his authorship of the plays a physical impossibility. But they make it an intellectual miracle. Perhaps I may be allowed to set off this marvel against that other portent, Will Shakspere's knowledge and frequent use of terms of Law. I do not pretend to understand how Will came to have them at the tip of his pen. Thus it may be argued that the Sonnets are by Bacon and no other man, because the Law is so familiar to the author, and his legal terms are always used with so nice an accuracy, that only Bacon can have been capable of these mysterious productions. (But why was Bacon so wofully inaccurate in points of scholarship and history?) By precisely the same argument Lord Penzance proves that Bacon (not Ben, as Mr. Greenwood holds) wrote for the players the Dedication of the Folio. "If it should be the case that Francis Bacon wrote the plays, he would, probably, afterwards have written the Dedication of the Folio, and the style of it" (stuffed with terms of law) "would be accounted for." Mr. Greenwood thinks that Jonson wrote the Dedication; so Ben, too, was fond of using legal terms in literature. "Legal terms abounded in all plays and poems of the period," says Sir Sidney Lee, and Mr. Greenwood pounces on the word "all." However he says, "We must admit that this use of legal jargon is frequently found in lay-writers, poets, and others of the Elizabethan period — in sonnets for example, where it seems to us intolerable." Examples are given from Barnabe Barnes. The lawyers all agree, however, that Shakespeare does the legal style "more natural," and more accurately than the rest. And yet I cannot

even argue that, if he did use legal terms at all, he would be sure to do it pretty well.

For on this point of Will's use of legal phraseology I frankly profess myself entirely at a loss. To use it in poetry was part of the worse side of taste at that period. The lawyers with one voice declare that Will's use of it is copious and correct, and that their "mystery" is difficult, their jargon hard to master; "there is nothing so dangerous," wrote Lord Campbell, "as for one not of the craft to tamper with our freemasonry." I have not tampered with it. Perhaps a man of genius who found it interesting might have learned the technical terms more readily than lawyers deem possible. But Will, so accurate in his legal terms, is so inaccurate on many other points; for example, in civil and natural history, and in classic lore. Mr. Greenwood proves him to be totally at sea as a naturalist. On the habits of bees, for example, "his natural history of the insect is as limited as it is inaccurate." Virgil, though not a Lord Avebury, was a great entomologist, compared with Will. About the cuckoo Will was recklessly misinformed. His Natural History was folklore, or was taken from that great mediæval storehouse of absurdities, the popular work of Pliny. "He went to contemporary error or antiquated fancy for his facts, not to nature," says a critic quoted by Mr. Greenwood. Was that worthy of Bacon?

All these charges against *le vieux Williams* (as Théophile Gautier calls our Will) I admit. But Will was no Bacon; Will had not "taken all knowledge for his province." Bacon, I hope, had not neglected Bees! Thus the problem, why is Will accurate in his legal terminology, and reckless of accuracy in quantity, in history, in classic matters, is not by me to be solved. I can only surmise that from curiosity, or for some other unknown reason, he had read law-books, or drawn information from Templars about the meaning of their jargon, and that, for once, he was technically accurate.

We have now passed in review the chief Baconian and Anti-Willian arguments against Will Shakespeare's authorship of the plays and poems. Their

chief argument for Bacon is *aut Diabolus*, *aut Franciscus*, which, freely interpreted, means, "If Bacon is not the author, who the devil is?"

We reply, that man is the author (in the main) to whom the works are attributed by every voice of his own generation which mentions them, namely, the only William Shakespeare that, from 1593 to the early years of the second decade of the following century, held a prominent place in the world of the drama. His authorship is explicitly vouched for by his fellow-players, Heminge and Condell, to whom he left bequests in his will; and by his sometime rival, later friend, and always critic, Ben Jonson; Heywood, player and playwright and pamphleteer, who had been one of Henslowe's "hands," and lived into the Great Rebellion, knew the stage and authors for the stage from within, and *his* "mellifluous Shakespeare" is "Will," as his Beaumont was "Frank," his Marlowe "Kit," his Fletcher, "Jack." The author of *Daiphantus* (1604), mentioning the popularity of *Hamlet*, styles it "one of friendly Shakespeare's tragedies." Shakespeare, to him, was our Will clearly, a man of known and friendly character. The other authors of allusions did not need to say *who* their "Shakespeare" was, any more than they needed to say *who* Marlowe or any other poet was. We have examined the possibly unprecedented argument which demands that they who mention Shakespeare as the poet must, if they would enlighten us, add explicitly that he is also the actor.

"But all may have been deceived" by the long conspiracy of the astute Bacon, or the Nameless One. To believe this possible, considering the eager and suspicious jealousy and volubility of rival playwrights, is to be credulous indeed. The Baconians, representing Will almost as incapable of the use of pen and ink as "the old hermit of Prague," destroy their own case. A Will who had to make his mark, like his father, could not pose as an author even to the call-boy of his company. Mr. Greenwood's bookless Will, with some crumbs of Latin, and some power of "bumbasting out a blank verse," is a rather less impossible pretender, indeed; but why and when did the speaker of patois, the bookless one, write blank verse, from 1592 onwards, and where are his blank verses? Where are the "works" of Poet-Ape? As to the man, even Will by tradition, whatever it

may be worth, he was "a handsome, well-shaped man; very good company, and of a very ready and pleasant, smooth wit." To his fellow-actors he was "so worthy a friend and fellow" (associate). To Jonson, "he was, indeed, honest, and of an open and free nature; had an excellent phantasy, brave notions, and gentle expressions, wherein he flowed so freely that sometimes it was necessary he should be stopped." If Jonson here refers, as I suppose he does, to his conversation, it had that extraordinary affluence of thoughts, each mating itself with as remarkable originality of richly figured expressions, which is so characteristic of the style of Shakespeare's plays. In this prodigality he was remote indeed from the style of the Greeks; "panting Time toils after him in vain," and even the reader, much more the listener, might say, *sufflaminandus est*; "he needs to have the brake put on."

Such, according to unimpeachable evidence, was Will. Only despair can venture the sad suggestion that, under the name of Shakespeare, Ben is here speaking of Bacon, as "falling into those things which could not escape laughter . . . which were ridiculous." But to this last poor shift and fantastic guess were the Anti-Willians and Baconians reduced.

Such was Shakespeare, according to a rival.

But it is "impossible" that a man should have known so much, especially of classical literature and courtly ways, and foreign manners and phrases, if he had no more, at most, than four or five years at a Latin school, and five or six years in that forcing-house of faculty, the London of the stage, in the flush of the triumph over the Armada.

"With innumerable sorts of English books and infinite fardles of printed pamphlets this country is pestered, all shops stuffed, and every study furnished," says a contemporary. If a doubter will look at the cheap and common books of that day (a play in quarto, and the Sonnets of Shakespeare, when new, were sold for fippence) in any great collection; he will not marvel that to a lover of books, poor as he might be, many were accessible. Such a man cannot be kept from books.

If the reader will look into "the translations and imitations of the classics which poured from the press . . . the poems and love-pamphlets and plays of the University wits" (when these chanced to be printed), "the tracts and dialogues in the prevailing taste," he will understand the literary soil in which the genius of Shakespeare blossomed as rapidly as the flowers in "Adonis' garden." The whole literature was, to an extent which we find tedious, saturated with classical myths, anecdotes, philosophic *dicta* — a world of knowledge of a kind then "in widest commonalty spread," but now so much forgotten that, to Baconians and the public, such lore seems recondite learning.

The gallants who haunted the stage, and such University wits as could get the money, or had talent (like Crichton) to "dispute their way through Europe," made the Italian tour, and, notoriously, were "Italianate." They would not be chary of reminiscences of Florence, Venice, and Rome. Actors visited Denmark and Germany. No man at home was far to seek for knowledge of Elsinore, the mysterious Venetian "tranect or common ferry," the gondolas, and the Rialto. There was no lack of soldiers fresh and voluble from the foreign wars. Only dullards, or the unthinking, can be surprised by the ease with which a quick-witted man, having some knowledge of Latin, can learn to read a novel in French, Italian, or Spanish. That Shakespeare was the very reverse of a dullard, of the clod of Baconian fancy, is proved by the fact that he was thought capable of his works. For courtly manners he had the literary convention and Lyly's Court Comedies, with what he saw when playing at the Court and in the houses of the great. As to untaught nobility of manners, there came to the Court of France in 1429, from a small pig-breeding village on the marches of Lorraine, one whose manners were deemed of exquisite grace, propriety, and charm, by all who saw and heard her: of her manners and swift wit and repartee, the official record of her trial bears concordant evidence. Other untaught gifts she possessed, and the historic record is unimpeached as regards that child of genius, Jeanne d'Arc.

"*Ne me dites jamais cette bête de mot*, *impossible*," said Napoleon: it is indeed a stupid word where genius is concerned.

If intellectual “miracles” were impossible to genius, even Bacon could not have been and done all that he was and did, and also the author of the Shakespearean plays and poems; even Ben could not have been the scholar that he was. For the rest, I need not return on my tracks and explain once more such shallow mysteries as the “Silence of Philip Henslowe,” and the lack of literary anecdotage about Shakespeare in a stupendously illiterate country town. Had Will, not Ben, visited Drummond of Hawthornden, we should have matter enough of the kind desired.

“We have the epics of Homer,” people say, “what matters it whether they be by a Man, or by a Syndicate that was in business through seven centuries? We have the plays of Shakespeare, what matters it whether he, or Bacon, or X. were, in the main, the author?”

It matters to us, if we hold such doubts to be fantastic pedantries, such guesses contrary to the nature of things; while we wish to give love and praise and gratitude where they are due; to that Achæan “Father of the rest”; and to “friendly Shakespeare.”

APPENDICES

APPENDIX I. "TROILUS AND CRESSIDA"

To myself *Troilus and Cressida* is, with *Henry VI*, Part I, the most mysterious among the Shakespearean plays. Here we find, if Will wrote it, or had any hand in it, the greatest poet of the modern world in touch with the heroes of the greatest poet of the ancient world; but the English author's eyes are dimmed by the mists and dust of post-Homeric perversions of the Tale of Troy. The work of perversion began, we know, in the eighth century before our era, when, by the author of the *Cypria*, these favourite heroes of Homer, Odysseus and Diomede, were represented as scoundrels, assassins, and cowards.

In the Prologue to the play (whosoever wrote it) we see that the writer is no scholar. He makes the Achæan fleet muster in "the port of *Athens*," of all places. Even Ovid gave the Homeric trysting-place, Aulis, in Bœotia. (This Prologue is not in the Folio of 1623.) Six gates hath the Englishman's Troy, and the Scæan is not one of them.

The loves of Troilus and Cressida, with Pandarus as go-between, are from the mediæval Troy books, and were wholly unknown to Homer, whose Pandarus is only notable for loosing a traitor's shaft at Menelaus, in time of truce, and for his death at the hand of Diomede. The play begins after the duel (Iliad, III) between Paris and Menelaus: in the play, not in Homer, Paris "retires hurt," as is at first reported. Hector has a special grudge against the Telamonian Aias. As in the Iliad there is a view of the Achæans, taken from the walls by Priam and Helen; so, in the play, Pandarus and Cressida review the Trojans re-entering the city. Paris turns out not to be hurt after all.

In Act i. Scene 3, the Achæans hold council, and regret the disaffection of Achilles. Here comes Ulysses' great speech on discipline, in armies, and in states, the gradations of rank and duty; commonly thought to be a leaf in Shakespeare's crown of bays. The speeches of Agamemnon and Nestor are dignified; indeed the poet treats Agamemnon much more kindly than Homer is wont to do. But the poet represents Achilles as laughing in his quarters at Patroclus's imitation of the cough and other infirmities of old Nestor, to which

Homer, naturally, never alludes. Throughout, the English poet regards Achilles with the eyes of his most infamous late Greek and ignorant mediæval detractors. The Homeric sequence of events is so far preserved that, on the day of the duel between Paris and Menelaus, comes (through Æneas) the challenge by Hector to fight any Greek in "gentle and joyous passage of arms" (Iliad, VII). As in the Iliad, the Greeks decide by lot who is to oppose Hector; but by the contrivance of Odysseus (not by chance, as in Homer) the lot falls on Aias. In the Iliad Aias is as strong and sympathetic as Porthos in *Les Trois Mousquetaires*. The play makes him as great an eater of beef, and as stupid as Sir Andrew Aguecheek. Achilles, save in a passage quite out of accord with the rest of the piece, is nearly as dull as Aias, is discourteous, and is cowardly! No poet and no scholar who knew Homer's heroes in Homer's Greek, could thus degrade them; and the whole of the revilings of Thersites are loathsome in their profusion of filthy thoughts. It does not follow that Will did not write the part of Thersites. Some of the most beautiful and Shakespearean pieces of verse adorn the play; one would say that no man but Will could have written them. Troilus and Cressida, at first, appear "to dally with the innocence of love"; and nothing can be nobler and more dramatic than the lines in which Cressida, compelled to go to her father, Calchas, in the Greek camp, in exchange for Antenor, professes her loyalty in love. But the Homeric and the alien later elements, — the story of false love, — cannot be successfully combined. The poet, whoever he was, appears to weary and to break down. He ends, indeed, as the Iliad ends, with the death of Hector, but Hector, in the play, is murdered, while resting unarmed, without shield and helmet, after stripping a suit of sumptuous mail from a nameless runaway. In the play he has slain Patroclus, but has not stripped him of the armour of Achilles, which, in Homer, he is wearing. Achilles then meets Hector, but far from rushing to avenge on him Patroclus, he retires like a coward, musters his men, and makes them surround and slay the defenceless Hector.

Cressida, who is sent to her father Calchas, in the Greek camp, in a day becomes "the sluttish spoil of opportunity," and of Diomede, and the comedy

praised by the preface-writer of a quarto of 1609, is a squalid tragedy reeking of Thersites and Pandarus, of a light o' love, and the base victory of cruel cowardice over knightly Hector. Yet there seemed to be muffled notes from the music, and broken lights from the splendour of Homer. When Achilles eyes Hector all over, during a truce, and insultingly says that he is thinking in what part of his body he shall drive the spear, we are reminded of Iliad, XXII, 320–326, where Achilles searches his own armour, worn by Patroclus, stripped by Hector from him, and worn by Hector, for a chink in the mail. Yet, after all, these points are taken, not from the Iliad, but from Caxton's popular Troy Book.

Once more, when Hector is dead, and Achilles bids his men to "cry amain, Achilles hath the mighty Hector slain,"

we think of Iliad, XXII, 390–393, where Achilles commands the Myrmidons to go singing the pæan "Glory have we won, we have slain great Hector!"

The sumptuous armour stripped by Hector from a nameless man, recalls his winning of the arms of Achilles from Patroclus. But, in fact, this passage is also borrowed, with the murder of Hector, from Caxton, except as regards the pæan.

It may be worth noting that Chapman's first instalment of his translation of the Iliad, containing Books I, II, and VII–XI, appeared in 1598, and thence the author could adapt the passages from Iliad, Book VII. In or about 1598–9 occurred, in *Histriomastix*, by Marston and others, a burlesque speech in which Troilus, addressing Cressida, speaks of "thy knight," who "*Shakes* his furious *Speare*," while in April 1599, Henslowe's account-book contains entries of money paid to Dekker and Chettle for a play on Troilus and Cressida, for the Earl of Nottingham's Company. Of this play no more is known, nor can we be sure that Chapman's seven Books of the Iliad (I, II, VII–XI) of 1598 attracted the attention of playwrights, from Shakespeare to Chettle and Dekker, to Trojan affairs. The coincidences at least are curious. If "*Shakes* his furious *Speare*" in *Histriomastix* refers to Shakespeare in connection with Cressida, while, in 1599, Dekker and Chettle were doing a *Troilus and Cressida* for a company not Shakespeare's, then there were *two Troilus and Cressida* in the field. A licence to print a *Troilus and Cressida* was obtained in 1602–3, but the quarto of our

play, the Shakespearean play, is of 1609, "as it is acted by my Lord Chamberlain's men," that is, by Shakespeare's Company. Now Dekker and Chettle wrote, apparently, for Lord Nottingham's Company. One quarto of 1609 declares, in a Preface, that the play has "never been staled with the stage"; another edition of the same year, from the same publishers, has not the Preface, but declares that the piece "was acted by the King's Majesty's servants *at the Globe*." The author of the Preface (Ben Jonson, Mr. Greenwood thinks,) speaks only of a single author, who has written other admirable comedies. "When he is gone, and his comedies out of sale, you will scramble for them, and set up a new English Inquisition." Why? The whole affair is a puzzle. But if the author of the Preface is right about the single author of *Troilus and Cressida*, and if Shakespeare is alluded to in connection with Cressida, in *Histriomastix* (1599), then it appears to me that Shakespeare, in 1598–9, after Chapman's portion of the Iliad appeared, was author of one *Troilus and Cressida*, extant in 1602–3 (when its publication was barred till the publisher "got authority"), while Chettle and Dekker, in April 1599, were busy with another *Troilus and Cressida*, as why should they not be? In an age so lax about copyright, if their play was of their own original making, are we to suppose that there was copyright in the names of the leading persons of the piece, Troilus and Cressida?

Perhaps not: but meanwhile Mr. Greenwood cites Judge Stotsenburg's opinion that Henslowe's entries of April 1599 "refute the Shakespearean claim to the authorship of *Troilus and Cressida*," which exhibits "the collaboration of

two men," as "leading commentators" hold that it does. But the learned Judge mentions as a conceivable alternative that "there were two plays on the subject with the same name," and, really, it looks as if there were! The Judge does not agree "with Webb and other gifted writers that Bacon wrote this play." So far the Court is quite with him. He goes on however, "It was, in my opinion, based on the foregoing facts, originally the production of Dekker and Chettle, added to and philosophically dressed by Francis Bacon." But, according to Mr. Greenwood, "it is admitted not only that the different writing of two authors is apparent in the Folio play, but also that 'Shakespeare' must have had at least some share in a play of *Troilus and Cressida* as early as the very year 1599, in the spring of which Dekker and Chettle are found engaged in writing their play of that name," on the evidence of *Histriomastix*. How that evidence proves that "a play of *Troilus and Cressida* had been *published* as by 'Shakespeare' about 1599," I know not. Perhaps "published" means "acted"? "And it is not unreasonable to suppose that this play" ("published as by Shakespeare") "was the one to which Henslowe alludes" — as being written in April 1599, by Dekker and Chettle.

If so, the play must show the hands of three, not two, men, Dekker, Chettle, and "Shakespeare," the Great Unknown, or Bacon. He collaborates with Dekker and Chettle, in a play for Lord Nottingham's men (according to Sir Sidney Lee), but it is, later at least, played by Shakespeare's company; and perhaps Bacon gets none of the £4 paid to Dekker and Chettle. Henslowe does not record his sale of the Dekker and Chettle play to Shakespeare's or to any company or purchaser. Without an entry of the careful Henslowe recording his receipts for the sale of the Dekker and Chettle play to any purchaser, it is not easy to see how Shakespeare's company procured the manuscript, and thus enabled him to refashion it. Perhaps no reader will fail to recognise his hand in the beautiful blank verse of many passages. I am not familiar enough with the works of Dekker and Chettle to assign to them the less desirable passages. Thersites is beastly: a Yahoo of Swift's might poison with such phrases as his the name and nature of love, loyalty, and military courage. But whatsoever Shakespeare did,

he did thoroughly, and if he were weary, if man delighted him not, nor woman either, he may have written the whole piece, in which love perishes for the whim of "a daughter of the game," and the knightly Hector is butchered to sate the vanity of his cowardly Achilles. If Shakespeare read the books translated by Chapman, he must have read them in the same spirit as Keats, and was likely to find that the poetry of the Achæan could not be combined with the Ionian, Athenian, and Roman perversions, as he knew them in the mediæval books of Troy, in the English of Lydgate and Caxton. The chivalrous example of Chaucer he did not follow. Probably Will looked on the play as one of his failures. The Editor, if we can speak of an Editor, of the Folio clearly thrust the play in late, so confusedly that it is not paged, and is not mentioned in the table of the contents.

"The Grand Possessors" of the play referred to in the Preface to one of the two quartos of 1609 we may suppose to be Shakespeare's Company. In this case the owners would not permit the publication of the play if they could prevent it. The title provokes Mr. Greenwood to say, "Why these worthies should be so styled is not apparent; indeed the supposition seems not a little ridiculous." Of course, if the players were the possessors, "grand" is merely a jeer, by a person advertising a successful piracy. And in regard to Tieck's conjecture that James I is alluded to as "the grand possessor, for whom the play was expressly written," the autocratic James was very capable of protecting himself against larcenous publishers.

APPENDIX II. CHETTLE'S SUPPOSED ALLUSION TO WILL SHAKSPERE

In discussing contemporary allusions to William Shakspere or Shakespeare (or however you spell the name), I have not relied on Chettle's remarks (in *Kind-Hart's Dreame*, 1592) concerning Greene's *Groatsworth of Wit*. Chettle speaks of it, saying, "in which a letter, written to divers playmakers, is offensively by one or two of them taken." It appears that by "one or two" Chettle means *two*. "With *neither* of them that take offence was I acquainted" (at the time when he edited the *Groatsworth*), "and with one of them I care not if I never be." We do not know who "the Gentlemen his Quondam acquaintance," addressed by Greene, were. They are usually supposed to have been Marlowe, Peele, and Lodge, or Nash. We do not know which of the two who take offence is the man with whom Chettle did not care to be acquainted. Of "the other," according to Chettle, "myself have seen his demeanour no less civil than he is excellent in the quality he professes" (that is, "in his profession," as we say), "besides divers of worship have reported his uprightness of dealing, which argues his honesty; and his facetious grace in writing that approves his art."

Speaking from his own observation, Chettle avers that the person of whom he speaks is civil in his demeanour, and (*apparently*) that he is "excellent in the quality he professes" — in his profession. Speaking on the evidence of "divers of worship," the same man is said to possess "facetious grace in writing." Had his writings been then published, Chettle, a bookish man, would have read them and formed his own opinion. Works of Lodge, Peele, and Marlowe had been published. Writing is *not* "the quality he professes," is not the "profession" of the man to whom Chettle refers. On the other hand, the profession of Greene's "Quondam acquaintance" *was* writing, "they spend their wits in making Plays." Thus the man who wrote, but whose profession was not that of writing, does not, so far, appear to have been one of those addressed by Greene. It seems undeniable that Greene addresses gentlemen who are "playmakers," who "spend

their wits in making Plays," and who are *not* actors; for Greene's purpose is to warn them against the rich, ungrateful actors. If Greene's friends, at the moment when he wrote, were, or if any one of them then was, by profession an actor, Greene's warning to him against actors, directed to an actor, is not, to me, intelligible. But Mr. Greenwood writes, "As I have shown, George Peele was one of the playwrights addressed by Greene, and Peele was a successful player as well as playwright, and might quite truly have been alluded to both as having 'facetious grace in writing,' and being 'excellent in the quality he professed,' that is, as a professional actor."

I confess that I did not know that George Peele, M.A., of Oxford, had ever been a player, and a successful player. But one may ask, — in 1592 did George Peele "profess the quality" of an actor; was he then a professional actor, and only an occasional playwright? If so, I am not apt to believe that Greene seriously advised him not to put faith in the members of his own profession. From them, as a successful member of their profession (a profession which, as Greene complains, "exploited" dramatic authors), Peele stood in no danger. Thus I do not see how Chettle's professional actor, reported to have facetious grace in writing, can be identified with Peele. The identification seems to me impossible. Peele and Marlowe, in 1592, were literary gentlemen; Lodge, in 1592, was filibustering, though a literary man; he had not yet become a physician. In 1592, none of the three had any profession but that of literature, so far as I am aware. The man who had a special profession, and also wrote, was not one of these three; nor was he Tom Nash, a mere literary gentleman, pamphleteer and playwright.

I do not know the name of any one of the three to whom Greene addressed the *Groatsworth*, though the atheistic writer of tragedies seems meant, and disgracefully meant, for Marlowe. I only know that Chettle is expressing his regrets for Greene's language to some one whom he applauded as to his exercise of his profession; and who, according to "divers of worship," had also "facetious grace in writing." "Myself have seen him no less civil than he is excellent in the quality he professes"; whether or not this means that Chettle has *seen* his

excellence in his profession, I cannot tell for certain; but Chettle's remark is, at least, contrasted with what he gives merely from report— "the facetious grace in writing" of the man in question. *His* writing is not part of his profession, so he is not, in 1592 (I conceive), Lodge, Peele, Marlowe, or Nash.

Who, then, is this mysterious personage? Malone, Dyce, Steevens, Collier, Halliwell-Phillipps, Knight, Sir Sidney Lee, Messrs. Gosse and Garnett, and Mr. J. C. Collins say that he is Will Shakspere. But Mr. Fleay and Mr. Castle, whose "mind" is "legal," have pointed out that this weird being cannot be Shake-scene (or Shakspere, if Greene meant Shakspere), attacked by Greene. For Chettle says that in the *Groatsworth of Wit* "a letter, written to divers playmakers, is offensively by one or two of them taken." The mysterious one is, therefore, one of the playwrights addressed by Greene. Consequently all the followers of Malone, who wrote before Messrs. Fleay and Castle, are mistaken; and what Mr. Greenwood has to say about Sir Sidney Lee, J. C. Collins, and Dr. Garnett, and Mr. Gosse, in the way of moral reprobation, may be read by the curious in his pages.

Meanwhile, if we take Chettle to have been a strict grammarian, by his words — "a letter, written to divers playmakers, is offensively by one or two of them taken," Will is excluded; the letter was most assuredly not written to *him*. But I, whose mind is not legal, am not certain that Chettle does not mean that the letter, written to divers playmakers, was by one or two makers of plays offensively taken.

This opinion seems the less improbable, as the person to whom Chettle is most apologetic excels in a quality or profession, which is contrasted with, and is not identical with, "his facetious grace in writing" — a *parergon*, or " bye-work," in his case. Whoever this person was, he certainly was not Marlowe, Peele, Lodge, or Nash. We must look for some other person who had a profession, and also was reported to have facetious grace in writing.

If Chettle is to be held tight to grammar, Greene referred to some one unknown, some one who wrote for the stage, but had another profession. If Chettle is not to be thus tautly construed, I confess that to myself he seems to

have had Shakspere, even Will, in his mind. For Will in 1592 had “a quality which he professed,” that of an actor; and also (I conceive) was reported to have “ facetious grace in writing.” But other gentlemen may have combined these attributes; wherefore I lay no stress on the statements of Chettle, as if they referred to our Will Shakspere.

Forty Years of Bacon-Shakespeare Folly by John Fiske

From 'A Century of Science and Other Essays'

Some time ago, while I happened to be looking over a wheelbarrow-load of rubbish written to prove that such plays as "King Lear" and "The Merry Wives of Windsor" emanated from one of the least poetical and least humorous minds of modern times, I was reminded of a story which I heard when a boy. I forget whether it was some whimsical man of letters like Charles Lamb, or some such professional wag as Theodore Hook, who took it into his head one day to stand still on a London street, with face turned upward, gazing into the sky. Thereupon the next person who came that way forthwith stopped and did likewise, and then the next, and the next, until the road was blocked by a dense crowd of men and women, all standing as if rooted in the ground, and with solemn sky-ward stare. The enchantment was at last broken when some one asked what they were looking at, and nobody could tell. It was simply an instance of a certain remnant of primitive gregariousness of action on the part of human beings, which exhibits itself from time to time in sundry queer fashions and fads.

So when Miss Delia Bacon, in the year which saw the beginning of "The Atlantic Monthly," published a book purporting to unfold the "philosophy" of Shakespeare's dramas, it was not long before other persons began staring intently into the silliest mare's nest ever devised by human dulness; and the fruits of so much staring have appeared in divers eccentric volumes, of which more specific mention will presently be made. Neither in number nor in quality are they such as to indicate that the Bacon-Shakespeare folly has yet become fashionable, and we shall presently observe in it marked suicidal tendencies which are likely to prevent its ever becoming so; but there are enough of such volumes to illustrate the point of my anecdote.

Another fad, once really fashionable, and in defence of which some plausible arguments could be urged, was the Wolfian theory of the Homeric poems, which dazzled so many of our grandparents. It is worth our while to mention it here by way of prelude. The theory that the Iliad and Odyssey are mere aggregations of popular ballads, collected and arranged in the time of Pisistratus, was perhaps originally suggested by the philosopher Vico, but first attracted general attention in 1795, when set forth by Friedrich August Wolf, one of the most learned and brilliant of modern scholars. Thus eminently respectable in its parentage and quite reasonable on the surface, this ballad theory came to be widely fashionable; forty years ago it was accepted by many able scholars, though usually with large modifications.

The Wolfians urged that we know absolutely nothing about the man Homer, not even when or where he lived. His existence is merely matter of tradition, or of inference from the existence of the poems. But as the poems know nothing of Dorians in Peloponnesus, their date can hardly be so late as 1100 b. c. What happened, then, when "an edition of Homer" was made at Athens, about 530 b. c., by Pisistratus, or under his orders? Did the editor simply edit two great poems already six centuries old, or did he make up two poems by piecing together a miscellaneous lot of ancient ballads? Wolf maintained the latter alternative, chiefly because of the alleged impossibility of composing and preserving such long poems in the alleged absence of the art of writing. Having thus made a plausible start, the Wolfians proceeded to pick the poems to pieces, and to prove by "internal evidence" that there was nothing like "unity of design" in them, etc.; and so it went on, till poor old Homer was relegated to the world of myth. As a schoolboy I used to hear the belief in the existence of such a poet derided as "uncritical" and "unscholarly."

In spite of these terrifying epithets, the ballad theory never made any impression upon me; for it seemed to ignore the most conspicuous and vital fact about the poems, namely, the *style*, the noble, rapid, simple, vivid, supremely poetical style, — a style as individual and unapproachable as that of Dante or Keats. For an excellent characterization of it, read Matthew Arnold's charming

essays “On Translating Homer.” The style is the man, and to suppose that this Homeric style ever came from a democratic multitude of minds, or from anything save one of those supremely endowed individual natures such as get born once or twice in a millennium, is simply to suppose a psychological impossibility. I remember once talking about this with George Eliot, who had lately been reading Frederick Paley’s ingenious restatement of the ballad theory, and was captivated by its ingenuity. I told her I did not wonder that old dry-as-dust philologists should hold such views, but I was indeed surprised to find such a literary artist as herself ignoring the impassable gulf between Homer’s language and that which any ballad theory necessarily implies. She had no answer for this except to say that she should have supposed an evolutionist like me would prefer to regard the Homeric poems as gradually evolved rather than suddenly created! A retort so clever and amiable most surely entitled her to the woman’s privilege of the last word.

The Wolfian theory may now be regarded as a thing of the past; it has had its day and been flung aside. If Wolf himself were living, he would be the first to laugh at it. Its original prop has been knocked away, since it has become pretty clear that the art of writing was practised about the shores of the Ægean Sea long before 1100 b. c. Even Wolf would now admit that it might have been a real letter that Bellerophon carried to the father of Anteia. All attempts to show a lack of unity in the design of the Iliad and the Odyssey have failed irretrievably, and the discussion has served only to make more and more unmistakable the work of the mighty master. The ballad theory is dead and buried, and he who would read its obituary may find keen pleasure, as well as many a wholesome lesson in sound criticism, in the sensible and brilliant book by Andrew Lang on “Homer and the Epic.”

The Bacon-Shakespeare folly has never been set forth by scholars of commanding authority, like Wolf and Lachmann, or Niese and Wilamowitz Moellendorff. Among Delia Bacon’s followers not one can by any permissible laxity of speech be termed a scholar, and their theory has found acceptance with very few persons. Nevertheless, it illustrates as well as the Wolfian theory the

way in which such notions grow. It starts from a false premise, hazily conceived, and it subsists upon arguments in which trivial facts are assigned higher value than facts of vital importance. Mr. Lang's remark upon certain learned Homeric commentators, "that they pore over the hyssop on the wall, but are blind to the cedar of Lebanon," applies with tenfold force to the Bacon-Shakespeare sciolists. In them we always miss the just sense of proportion which is one of the abiding marks of sanity. The unfortunate lady who first brought their theory into public notoriety in 1857 was then sinking under the cerebral disease of which she died two years later, and her imitators have been chiefly weak minds of the sort that thrive upon paradox, closely akin to the circle-squarers and inventors of perpetual motion. Underlying all the absurdities, however, there is something that deserves attention. Like many other morbid phenomena, the Bacon-Shakespeare folly has its natural history which is instructive. The vagaries of Delia Bacon and her followers originated in a group of conditions which admit of being specified and described, and which the historian of nineteenth-century literature will need to notice. In order to understand the natural history of the affair, it is necessary to examine the Delia Bacon theory at greater length than it would otherwise deserve. Let us see how it is constructed.

It starts with a syllogism, of which the major premise is that the dramas ascribed to Shakespeare during his lifetime, and ever since believed to be his, abound in evidences of extraordinary book-learning. The minor premise is that William Shakespeare of Stratford-on-Avon could not have acquired or possessed so much book-learning. The conclusion is that he could not have written those plays.

The question then arises, Which of Shakespeare's contemporaries had enough book-lore to have written them? No doubt Francis Bacon had enough. The conclusion does not follow, however, that he wrote the plays; for there were other contemporaries with learning enough and to spare, as for example George Chapman and Ben Jonson. These two men, to judge from their acknowledged works, were great poets, whereas in Bacon's fifteen volumes there is not a paragraph which betrays poetical genius. Why not, then, ascribe the Shakespeare

dramas to Chapman or Jonson? Here the Baconizers endeavour to support their assumption by calling attention to similarities in thought and phrase between Francis Bacon and the writer of the dramas. Up to this point their argument consists of deductions from assumed premises; here they adduce inductive evidence, such as it is. We shall see specimens of it by and by. At present we are concerned with the initial syllogism.

And first, as to the major premise, it must be met with a flat denial. The Shakespeare plays do not abound with evidences of scholarship or learning of the sort that is gathered from profound and accurate study of books. It is precisely in this respect that they are conspicuously different from many of the plays contemporary with them, and from other masterpieces of English literature. Such plays as Jonson's "Sejanus" and "Catiline" are the work of a scholar deeply indoctrinated with the views and mental habits of classic antiquity; he has soaked himself in the style of Lucan and Seneca, until their mental peculiarities have become like a second nature to him, and are unconsciously betrayed alike in the general handling of his story and in little turns of expression. Or take Milton's "Lycidas:" no one but a man saturated in every fibre with Theocritus and Virgil could have written such a poem. An extremely foreign and artificial literary form has been so completely mastered and assimilated by Milton that he uses it with as much ease as Theocritus himself, and has produced a work that even the master of idyls had scarcely equalled. After the terrific invective against the clergy and the beautiful invocation to the flowers, followed by the triumphant hallelujah of Christian faith, observe the sudden reversion to pagan sentiment where Lycidas is addressed as the genius of the shore. Only profound scholarship could have written this wonderful poem, — could have brought forth the Christian thought as if spontaneously through the medium of the pagan form. Now there is nothing of this sort in Shakespeare. He uses classical materials, or anything else under the sun that suits his purpose. He takes a chronicle from Holinshed, a biography from North's translation of Plutarch, a legend from Saxo Grammaticus through Belleforest's French version, a novel of Boccaccio, a miracle play, — whatever

strikes his fancy; he chops up his materials and weaves them into a story without much regard to classical models; defying rules of order and unity, and not always heeding probability, but never forgetful of his abiding purpose, to create live men and women. These people may have Greek or Latin names, and their scene of action may be Rome or Mitylene, decorated with scraps of classical knowledge such as a bright man might pick up in miscellaneous reading; but all this is the superficial setting, the mere frame to the picture. The living canvas is human nature as Shakespeare saw it in London and depicted with supreme poetic faculty. Among the new books within his reach was Chapman's magnificent translation of the Iliad, which at a later day inspired Keats to such a noble outburst of encomium; and in "Troilus and Cressida" we have the Greek and Trojan heroes set before us with an incisive reality not surpassed by Homer himself. This play shows how keenly Shakespeare appreciated Homer, how delicately and exquisitely he could supplement the picture; but there is nothing in its five acts that shows him clothed in the garment of ancient thought as Milton wore it. Shakespeare's freedom from such lore is a great advantage to him; in "Troilus and Cressida" there is a freedom of treatment hardly possible to a professional scholar. It is because of this freedom that Shakespeare reaches a far wider public of readers and listeners than Milton or Dante, whose vast learning makes them in many places "caviare to the general." Book-lore is a great source of power, but one may easily be hampered by it. What we forever love in Homer is the freshness that comes with lack of it, and in this sort of freshness Shakespeare agrees with Homer far more than with the learned poets.

It is not for a moment to be denied that Shakespeare's plays exhibit a remarkable wealth of varied knowledge. The writer was one of the keenest observers that ever lived. In the woodland or on the farm, in the printing shop or the alehouse, or up and down the street, not the smallest detail escaped him. Microscopic accuracy, curious interest in all things, unlimited power of assimilating knowledge, are everywhere shown in the plays. These are some of the marks of what we call *genius*, — something that we are far from comprehending, but which experience has shown that books and universities

cannot impart. All the colleges on earth could not by combined effort make the kind of man we call a genius, but such a man may at any moment be born into the world, and it is as likely to be in a peasant's cottage as anywhere.

There is nothing in which men differ more widely than in the capacity for imbibing and assimilating knowledge. The capacity is often exercised unconsciously. When my eldest son, at the age of six, was taught to read in the course of a few weeks of daily instruction, it was suddenly discovered that his four-year-old brother also could read. Nobody could tell how it happened. Of course the younger boy must have taken keen notice of what the elder one was doing, but the process went on without attracting attention until the result appeared.

This capacity for unconscious learning is not at all uncommon. It is possessed to some extent by everybody; but a very high degree of it is one of the marks of genius. I remember one evening, many years ago, hearing Herbert Spencer in a friendly discussion regarding certain functions of the cerebellum. Abstruse points of comparative anatomy and questions of pathology were involved. Spencer's three antagonists were not violently opposed to him, but were in various degrees unready to adopt his views. The three were: Huxley, one of the greatest of comparative anatomists; Hughlings Jackson, a very eminent authority on the pathology of the nervous system; and George Henry Lewes, who, although more of an amateur in such matters, had nevertheless devoted years of study to neural physiology, and was thoroughly familiar with the history of the subject. Spencer more than held his ground against the others. He met fact with fact, brought up points in anatomy the significance of which Huxley confessed that he had overlooked, and had more experiments and clinical cases at his tongue's end than Jackson could muster. It was quite evident that he knew all they knew on the subject, and more besides. Yet Spencer had never been through a course of "regular training" in the studies concerned; nor had he ever studied at a university, or even at a high school. Where did he learn the wonderful mass of facts which he poured forth that evening? Whence came his tremendous grasp upon the principles involved? Probably he could not have told you. A few days

afterward I happened to be talking with Spencer about history, a subject of which he modestly said he knew but little. I told him I had often been struck with the aptness of the historic illustrations cited in many chapters of his "Social Statics," written when he was twenty-nine years old. The references were not only always accurate, but they showed an intelligence and soundness of judgment unattainable, one would think, save by close familiarity with history. Spencer assured me that he had never read extensively in history. Whence, then, this wealth of knowledge, — not smattering, not sciolism, but solid, well-digested knowledge? Really, he did not know, except that when his interest was aroused in any subject he was keenly alive to all facts bearing upon it, and seemed to find them whichever way he turned. When I mentioned this to Lewes, while recalling the discussion on the cerebellum, he exclaimed: "Oh, you can't account for it! It's his genius. Spencer has greater instinctive power of observation and assimilation than any man since Shakespeare, and he is like Shakespeare for hitting the bull's-eye every time he fires. As for Darwin and Huxley, we can follow their intellectual processes, but Spencer is above and beyond all; he is inspired!"

Those were Lewes's exact words, and they made a deep impression upon me. The comparison with Shakespeare struck me as a happy one, and I can understand both Spencer and Shakespeare the better for it. Concerning Spencer one circumstance may be observed. Since his early manhood he has lived in London, and has had for his daily associates men of vast attainments in every department of science. He has thus had rare opportunities for absorbing an immense fund of knowledge unconsciously.

It is evident that the author of Shakespeare's plays possessed an extraordinary "instinctive power of observation and assimilation." There was nothing strange in such a genius growing up in a small Warwickshire town. The difficulty is one which the Delia-Baconians have created for themselves. As it is their chief stock in trade, they magnify it in every way they can think of. Shakespeare's parents, they say, were illiterate, and he did not know how to spell his own name. It appears as Shagspere, Shaxpur, Shaxberd, Chacsper, and so on through some

thirty forms, several of which William Shakespeare himself used indifferently. The implication is that such a man must have been shockingly ignorant. The real ignorance, however, is on the part of those who use such an argument. Apparently, they do not know that in Shakespeare's time such laxity in spelling was common in all ranks of society and in all grades of culture. The name of Elizabeth's great Lord Treasurer, Cecil, and his title, Burghley, were both spelled in half a dozen ways. The name of Raleigh occurs in more than forty different forms, and Sir Walter, one of the most accomplished men of his time, wrote it Rauley, Rawleyghe, Ralegh, and in yet other ways. The talk of the Baconizers on this point is simply ludicrous.

Equally silly is their talk about the dirty streets of Stratford. They seem to have just discovered that Elizabeth's England was a badly drained country, with heaps of garbage in the streets. Shakespeare's father, they tell us, was a butcher, and evidently from a butcher's son, living in an ill-swept town, and careless about the spelling of his name, not much in the way of intellectual achievement was to be expected! In point of fact, Shakespeare's parents belonged to the middle class. His father owned several houses in Stratford and two or three farms in the neighbourhood. As a farmer in those days, he would naturally have cattle slaughtered on his premises and would sell wool off the backs of his own flocks, whence the later tradition of his having been butcher and wool dealer. That his social position was good is shown by the facts that he was chief alderman and high bailiff of Stratford, and justice of the peace, and was styled "Master John Shakespeare," or (as we should say) "Mr.;" whereas, had he been one of the common folk, his style had been "Goodman Shakespeare." A visit to his home in Henley Street, and to Anne Hathaway's cottage at Shottery, shows that the two families were in eminently respectable circumstances. The son of the high bailiff would see the best people in the neighbourhood. There was in the town a remarkably good free grammar school, where he might have learned the "small Latin and less Greek" which his friend Ben Jonson assures us he possessed. This expression, by the way, is usually misunderstood, because people do not pause to consider it. Coming from Ben Jonson, I should say that

“small Latin and less Greek” might fairly describe the amount of those languages ordinarily possessed by a member of the graduating class at Harvard in good standing. It can hardly imply less than the ability to read Terence at sight, and perhaps Euripides less fluently. The author of the plays, with his unerring accuracy of observation, knows Latin enough at least to use the Latin part of English most skilfully; at the same time, when he has occasion to use Greek authors, such as Homer or Plutarch, he usually prefers an English translation. At all events, Jonson’s remark informs us that the man whom he addresses as “sweet swan of Avon” knew *some* Latin and *some* Greek, — a conclusion which is so distasteful to one of our Baconizers, Mr. Edwin Reed, that he will not admit it. Rather than do so, he has the assurance to ask us to believe that by the epithet “sweet swan of Avon” Jonson really meant Francis Bacon! Dear me, Mr. Reed, do you really mean it? And how about the editor of Beaumont and Fletcher in 1647, when, in his dedication to Shakespeare’s friend the Earl of Pembroke, he speaks of “Sweet Swan of Avon Shakespear”? Was he too a participator in the little scheme for fooling posterity? Or was he one of those who were fooled?

Whether Shakespeare had other chances for book-lore than those which the grammar school afforded, whether there was any interesting parson at hand, as often in small towns, to guide and stimulate his unfolding thoughts, — upon such points we have no information. But there were things to be learned in the country town quite outside of books and pedagogues. There, while the poet listened to the “strain of strutting chanticleer,” and watched the “sun-burn’d sicklemen, of August weary,” putting on their rye-straw hats and making holiday with rustic nymphs, he could rejoice in

“Earth’s increase, foison plenty, Barns and garners never empty; Vines with clust’ring bunches growing; Plants with goodly burthen bowing;”

there he could see the “unbacked colts” prick their ears, advance their eyelids, lift up their noses, as if they smelt music; there he knew, doubtless, many a bank where the wild thyme grew and on which the moonlight sweetly slept; there he

watched the coming of “violets dim,” “pale primroses,” flower-de-luce, carnations, with “rosemary and rue” to keep their “savour all the winter long,”

“When icicles hang by the wall, And Dick the shepherd blows his nail, And Tom bears logs into the hall, And milk comes frozen home in pail.”

Such lore as this no books or college could impart.

It was this that Milton had in mind when he introduced Shakespeare and Ben Jonson into his poem “L’Allegro.” Milton was in his thirtieth year when Jonson, poet laureate, was laid to rest in Westminster Abbey; he was only a boy of eight years when Shakespeare died, but the beautiful sonnet written fourteen years later shows how lovingly he studied his works: —

“What needs my Shakespeare, for his honoured bones,” *etc.*

The poem “L’Allegro” and its fellow “Il Penseroso” describe the delights of Milton’s life at his father’s country house near Windsor Castle. He used often to ride into London to hear music or pass an evening at the theatre, as in the following lines: —

“Then to the well-trod stage anon, If Jonson’s learned sock be on, Or sweetest Shakespeare, fancy’s child, Warble his native woodnotes wild.”

This accurate and happy contrast exasperates the Baconizers, for it spoils their stock in trade, and accordingly they try their best to assure us that Milton did not know what he was writing about. They asseverate with vehemence that in all the seven-and-thirty plays there is no such thing as a native woodnote wild.

But before leaving the contrast we may pause for a moment to ask, Where did Ben Jonson get his learning? He was, as he himself tells us, “poorly brought up” by his stepfather, a bricklayer. He went to Westminster School, where he was taught by Camden, and he may have spent a short time at Cambridge, though this is doubtful. His schooling was nipped in the bud, for he had to go home and lay brick; and when he found such an existence insupportable he went into the army and fought in the Netherlands. At about the age of twenty we find him back in London, and there lose sight of him for five years, when all at once his great comedy “Every Man in his Humour” is performed, and makes him famous. Now, in such a life, when did Jonson get the time for his immense reading and

his finished classical scholarship? Reasoning after the manner of the Delia-Baconians, we may safely say that he could not possibly have accumulated the learning which is shown in his plays: therefore he could not have written those plays; therefore Lord Bacon must have written them! There are daring soarers in the empyrean who do not shrink from this conclusion; a doctor in Michigan, named Owen, has published a pamphlet to prove, among other things, that Bacon was the author of the plays which were performed and printed as Jonson's.

To return to Shakespeare. Somewhere about 1585, when he was one-and-twenty, he went to London, leaving his wife and three young children at Stratford. His father had lost money, and the fortunes of the family were at the lowest ebb. In London we lose sight of Shakespeare for a while, just as we lose sight of Jonson, until literary works appear. The work first published is "Venus and Adonis," one of the most exquisite pieces of diction in the English language. It was dedicated to Henry, Earl of Southampton, by William Shakespeare, whose authorship of the poem is asserted as distinctly as the title-page of "David Copperfield" proclaims that novel to be by Charles Dickens, yet some precious critics assure us that Shakespeare "could not" have written the poem, and never knew the Earl of Southampton. Some years ago, Mr. Appleton Morgan, who does not wish to be regarded as a Baconizer, published an essay on the Warwickshire dialect, in which he maintained that since no traces of that kind of speech occur in "Venus and Adonis," therefore it could not have been written by a young man fresh from a small Warwickshire town. This is a specimen of the loose kind of criticism which prepares soil for Delia-Baconian weeds to grow in. The poem was published in 1593, seven or eight years after Shakespeare's coming to London; and we are asked to believe that the world's greatest genius, one of the most consummate masters of speech that ever lived, could tarry seven years in the city without learning how to write what Hosea Biglow calls "citified English"! One can only exclaim with Gloster, "O monstrous fault, to harbour such a thought!"

In those years Shakespeare surely learned much else. It seems clear that he had a good reading acquaintance with French and Italian, though he often uses translations, as for instance Florio's version of Montaigne. In estimating what Shakespeare "must have" known or "could not have" known, one needs to use more caution than some of our critics display. For example, in "The Winter's Tale" the statue of Hermione is called "a piece ... now newly performed by that rare Italian master, Julio Romano." Now, since Romano is known as a great painter, but not as a sculptor, this has been cited as a blunder on Shakespeare's part. It appears, however, that the first edition of Vasari's "Lives of the Painters," published in 1550 and never translated from its original Italian, informs us that Romano did work in sculpture. In Vasari's second edition, published in 1568 and translated into several languages, this information is not given. From these facts, the erudite German critic Dr. Karl Elze, who is not a bit of a Delia-Baconian, but only an occasional sufferer from *vesania commentatorum*, introduces us to a solemn dilemma: either the author of "The Winter's Tale" must have consulted the first edition of Vasari in the original Italian, or else he must have travelled in Italy and gazed upon statues by Romano. Ah! prithee not so fast, worthy doctor; be not so lavish with these "musts." It is, I think, improbable that Shakespeare ever saw Italy except with the eyes of his imperial fancy. On the other hand, there are many indications that he could read Italian, but among them we cannot attach much importance to this one. Why should he not have learned from *hearsay* that Romano had made statues? In the name of common sense, are there no sources of knowledge save books? Or, since it was no unusual thing for Italian painters in the sixteenth century to excel in sculpture and architecture, why should not Shakespeare have assumed without verification that it was so in Romano's case? It was a tolerably safe assumption to make, especially in an age utterly careless of historical accuracy, and in a comedy which provides Bohemia with a sea-coast, and mixes up times and customs with as scant heed of probability as a fairy tale.

In arguing about what Shakespeare "must have" or "could not have" known, we must not forget that at no time or place since history began has human

thought fermented more briskly than in London while he was living there. The age of Drake and Raleigh was an age of efflorescence in dramatic poetry, such as had not been seen in the twenty centuries since Euripides died. Among Shakespeare's fellow craftsmen were writers of such great and varied endowments as Chapman, Marlowe, Greene, Nash, Peele, Marston, Dekker, Webster, and Cyril Tourneur. During his earlier years in London, Richard Hooker was master of the Middle Temple, and there a little later Ford and Beaumont were studying. The erudite Camden was master of Westminster School; among the lights of the age for legal learning were Edward Coke and Francis Bacon; at the same time, one might have met in London the learned architect Inigo Jones and the learned poet John Donne, both of them excellent classical scholars; there one would have found the divine poet Edmund Spenser, just come over from Ireland to see to the publication of his "Faerie Queene;" not long afterward came John Fletcher from Cambridge, and the acute philosopher Edward Herbert from Oxford and one and all might listen to the incomparable table-talk of that giant of scholarship, John Selden. The delights of the Mermaid Tavern, where these rare wits were wont to assemble, still live in tradition. As Keats says: —

"Souls of poets dead and gone, What Elysium have ye known, Happy field or mossy cavern, Choicer than the Mermaid Tavern?"

It has always been believed that this place was one of Shakespeare's favourite haunts. By common consent of scholars, it has been accepted as the scene of those contests of wit between Shakespeare and Jonson of which Fuller tells us when he compares Jonson to a Spanish galleon, built high with learning, but slow in movement, while he likens Shakespeare to an English cruiser, less heavily weighted, but apt for victory because of its nimbleness, — the same kind of contrast, by the way, as that which occurred to Milton.

But our Baconizing friends will not allow that Shakespeare ever went to the Mermaid, or knew the people who met there; at least, none but a few fellow dramatists. We have no documentary proof that he ever met with Raleigh, or Bacon, or Selden. Let us observe that, while these sapient critics are in some

cases ready to welcome the slightest circumstantial evidence, there are others in which they will accept nothing short of absolute demonstration. Did Shakespeare ever see a maypole? The word occurs just once in his plays, namely, in the "Midsummer Night's Dream," where little Hermia, quarrelling with tall Helena, calls her a "painted maypole;" but that proves nothing. I am not aware that there is any absolute documentary proof that Shakespeare ever set eyes on a maypole. It is nevertheless certain that in England, at that time, no boy could grow to manhood without seeing many a maypole. Common sense has some rights which we are bound to respect.

Now, Shakespeare's London was a small city of from 150,000 to 200,000 souls, or about the size of Providence or Minneapolis at the present time. In cities of such size, everybody of the slightest eminence is known all over town, and such persons are sure to be more or less acquainted with one another; it is a very rare exception when it is not so. Before his thirtieth year, Shakespeare was well known in London as an actor, a writer of plays, and the manager of a prominent theatre. It was in that year that Spenser, in his "Colin Clout's Come Home Again," alluding to Shakespeare under the name of Aëtion, or "eagle-like," paid him this compliment: —

"And there, though last, not least, is Aëtion; A gentler shepherd may nowhere be found; Whose muse, full of high thought's invention, Doth, like himself, heroically sound."

Four years after this, in 1598, Francis Meres published his book entitled "Palladis Tamia," a very interesting contribution to literary history. The author, who had been an instructor in rhetoric in the University of Oxford, was then living in London, near the Globe Theatre. In this book Meres tells his readers that "the sweet witty soul of Ovid lives in mellifluous and honey-tongued Shakespeare; witness his 'Venus and Adonis,' his 'Lucrece,' his sugared sonnets among his private friends, etc.... As Plautus and Seneca are accounted the best for comedy and tragedy among the Latins, so Shakespeare among the English is the most excellent in both kinds for the stage: for comedy, witness his 'Gentlemen of Verona,' his 'Errors,' his 'Love's Labour's Lost,' his 'Love's

Labour's Wonne,' his 'Midsummer Night's Dream,' and his 'Merchant of Venice;' for tragedy, his 'Richard II.,' 'Richard III.,' 'Henry IV.,' 'King John,' 'Titus Andronicus,' and his 'Romeo and Juliet.' As Epius Stolo said that the Muses would speak with Plautus's tongue if they would speak Latin, so I say that the Muses would speak with Shakespeare's fine filed phrase if they would speak English." In other passages Meres mentions Shakespeare's lyrical quality, for which he likens him to Pindar and Catullus; and the glory of his style, for which he places him along with Virgil and Homer. It thus appears that, at the age of thirty-four, this poet from Stratford was already ranked by critical scholars by the side of the greatest names of antiquity. Let me add that the popularity of his plays was making him a somewhat wealthy man, so that he had relieved his father from pecuniary troubles, and had just bought for himself the Great House at Stratford where the last years of his life were spent. His income seems already to have been equivalent to $10,000 a year in our modern money. His position had come to be such that he could extend patronage to others. It was in 1598 that through his influence Ben Jonson obtained, after many rebuffs, his first hearing before a London audience, when "Every Man in his Humour" was brought out at Blackfriars Theatre, with Shakespeare acting one of the parts.

To suppose that such a man as this, in a town the size of Minneapolis, connected with a principal theatre, writer of the most popular plays of the day, a poet whom men were already coupling with Homer and Pindar, — to suppose that such a man was not known to all the educated people in the town is simply absurd. There were probably very few men, women, or children in London, between 1595 and 1610, who did not know who Shakespeare was when he passed them in the street; and as for such wits as drank ale and sack at the Mermaid, as for Raleigh and Bacon and Selden and the rest, to suppose that Shakespeare did not know them well — nay, to suppose that he was not the leading spirit and brightest wit of those ambrosial nights — is about as sensible as to suppose that he never saw a maypole.

The facts thus far contemplated point to one conclusion. The son of a well-to-do magistrate in a small country town is born with a genius which the world has

never seen surpassed. Coming to London at the age of twenty-one, he achieves such swift success that within thirteen years he is recognized as one of the chief glories of English literature. During this time he is living in the midst of such a period of intellectual ferment as the world has seldom seen, and in a position which necessarily brings him into frequent contact with all the most cultivated men. Under such circumstances, there is nothing in the smallest degree strange or surprising in his acquiring the varied knowledge which his plays exhibit. The major premise of the Delia-Baconians has, therefore, nothing in it whatever. It is a mere bubble, an empty vagary, — only this, and nothing more.

Before leaving this part of the subject, however, there are still one or two points of interest to be mentioned. Shakespeare shows a fondness for the use of phrases and illustrations taken from the law; and on such grounds our Delia-Baconians argue that the plays must have been written by an eminent lawyer, such as the Lord Chancellor Bacon undoubtedly was. They feel that this is a great point on their side. One instance, cited by Nathaniel Holmes and other Baconizers, is the celebrated case of Sir James Hales, who committed suicide by drowning, and was accordingly buried at the junction of crossroads, with a stake through his body, while all his property was forfeited to the Crown. Presently his widow brought suit for an estate by survivorship in joint-tenancy. Her case turned upon the question whether the forfeiture occurred during her late husband's lifetime: if it did, he left no estate which she could take; if it did not, she took the estate by survivorship. The lady's counsel argued that so long as Sir James was alive he had not been guilty of suicide, and the instant he died the estate vested in his widow as joint-tenant. But the opposing counsel argued that the instant Sir James voluntarily made the fatal plunge, and therefore before the breath had left his body, the guilt of suicide was incurred and the forfeiture took place. The court decided in favour of this view, and the widow got nothing.

There can be little doubt that this decision is travestied in the conversation of the two clowns in "Hamlet" with regard to Ophelia's right to Christian burial. The first clown makes precisely the point upon which the ingenious counsel for the defendant had rested his argument: "If I drown myself wittingly, it argues an

act, and an act hath three branches; it is to act, to do, and to perform." In making this distinction the counsel had maintained that the second branch, or the doing, was the only thing for the law to consider. The talk of the clowns brings out the humour of the case with Shakespeare's inimitable lightness of touch.

The report of the Hales case was published in the volume of "Plowden's Reports" which was issued in 1578; and Mr. Holmes informs us that "there is not the slightest ground for a belief, on the facts which we know, that Shakespeare ever looked into 'Plowden's Reports.'" This is one of the cases where your stern Baconizer will not hear of anything short of absolute demonstration. Mere considerations of human probability might disturb the cogency of a neat little pair of syllogisms: —

(1.) The author of "Hamlet" must have read Plowden. Shakespeare never read Plowden. Therefore Shakespeare was not the author of "Hamlet."

(2.) The author of "Hamlet" must have read Plowden. The lawyer, Bacon, must have read Plowden. Therefore Bacon wrote "Hamlet."

With regard to the major premise here, one might freely deny it. The author of "Hamlet" might easily have got all the knowledge involved from an evening chat with some legal friend at an alehouse. Then as to the minor premise, what earthly improbability is there in Shakespeare's having dipped into Plowden? Can anybody but lawyers or law students enjoy reading reports of law cases? I remember that, when I was about ten years old, a favourite book with me was one entitled "Criminal Trials of All Countries, by a Member of the Philadelphia Bar." I read it and read it, until forbidden to read such a gruesome book, and then I read it all the more. One of the most elaborate reports in it was that of the famous case of Captain Donellan, tried in 1780 on a charge of poisoning his wife's brother, Sir Theodosius Boughton, a dissipated and diseased young man, who died very suddenly one day. A post-mortem inspection showed spots in the intestine, which three ordinary country doctors ascribed to poisoning by laurel water, while Sir John Hunter, one of the greatest authorities in Europe, testified that they might equally well have ensued upon death from apoplexy. The judge, Sir Francis Buller, saw fit, in his charge, to reckon this as the testimony of three

experts against one; and thus the jury were driven to a verdict of murder, though it was not proved that any murder had been committed. Captain Donellan, who lived in his brother-in-law's house, was a man of blameless life, an amateur chemist, much given to fooling with odorous liquids and hissing retorts. It was proved that he had been distilling laurel water, and one or two other suspicious circumstances were alleged. The whole trial was begun and ended on the same day, the jury were about twenty minutes in finding the captain guilty, and three days afterward he was hung. It was a case where reason was submerged and drowned under a wave of angry prejudice shrieking for a victim.

Now, if I did not forthwith write a play, and take the occasion to ridicule the judge's charge to the jury, it was because I could not write a play, not because I did not fully appreciate the insult to law and common sense which that unfortunate case involved. In view of this and other experiences, when I now read a play or a novel that contains an intelligent allusion to some law case, I am far from feeling driven to the conclusion that it must have been written by a lord chancellor.

If Shakespeare's dramas are proved by such internal evidence to have been written by a lawyer, that lawyer, by parity of reasoning, could hardly have been Francis Bacon. For he was preëminently a chancery lawyer, and chancery phrases are in Shakespeare conspicuously absent. The word "injunctions" occurs five times in the plays, once perhaps with a reference to its legal use ("Merchant of Venice," II. ix.); but nowhere do we find any exhibition of a knowledge of chancery law. His allusions to the common law are often very amusing, as when, in "Love's Labour's Lost," at the end of a brisk punning-match between Boyet and Maria, he offers to kiss her, laughingly asking for a grant of pasture on her lips, and she replies, "Not so; my lips are no common, though several they be." Again, in "The Comedy of Errors," "Dromio asserts that there is no time for a bald man to recover his hair. This having been written, the law phrase suggested itself, and he was asked whether he might not do it by fine and recovery, and this suggested the efficiency of that proceeding to bar heirs; and this started the conceit that thus the lost hair of another man would be recovered." In such

quaint allusions to the common law and its proceedings Shakespeare abounds, and we cannot help remembering that Nash, in his prefatory epistle to Greene's "Menaphon," printed about 1589, makes sneering mention of Shakespeare as a man who had left the "trade of Noverint," whereunto he was born, in order to try his hand at tragedy. The "trade of Noverint" was a slang expression for the business of attorney; and this passage has suggested that Shakespeare may have spent some time in a law office, as student or as clerk, either before leaving Stratford, or perhaps soon after his arrival in London. This seems to me not improbable. On the other hand, "The Merchant of Venice" contains such crazy law that it is hard to imagine it coming even from a lawyer's clerk. At all events, we may safely say that the legal knowledge exhibited in the plays is no more than might readily have been acquired by a man of assimilative genius associating with lawyers. It simply shows the range and accuracy of Shakespeare's powers of observation.

Let us come now to the second part of the Delia Bacon theory. Having satisfied herself that William Shakespeare could not have written the poems and plays published under his name, she jumped to the conclusion that Francis Bacon was the author. Surely, a singular choice! Of all men, why Francis Bacon? Why not, as I said before, George Chapman or Ben Jonson, men who were at once learned scholars and great poets? Chapman, like Marlowe, could write the "mighty line." Jonson had rare lyric power; his verses sing, as witness the wonderful "Do but look on her eyes," which Francis Bacon could no more have written than he could have jumped over the moon. To pitch upon Bacon as the writer of "Twelfth Night" or "Romeo and Juliet" is about as sensible as to assert that "David Copperfield" must have been written by Charles Darwin. After a familiar acquaintance of more than forty years with Shakespeare's works, of nearly forty years with Bacon's, the two men impress me as simply antipodal one to the other. A similar feeling was entertained by the late Mr. Spedding, the biographer and editor of Bacon; and no one has more happily hit off the vagaries of the Baconizers than the foremost Bacon scholar now living, Dr. Kuno Fischer, in his recent address before the Shakespeare Society at

Weimar. I used to wonder whether the Bacon-Shakespeare people really knew anything about Bacon, and, now that chance has led me to read their books, I am quite sure they do not. To their minds, his works are simply a storehouse of texts which serve them for controversial missiles, very much as scattered texts from the Bible used to serve our uncritical grandfathers.

Francis Bacon was one of the most interesting persons of his time, and, as is often the case with such many-sided characters, posterity has held various opinions about him. On the one hand, his fame has grown brighter with the years; on the other hand, it has come to be more or less circumscribed and limited. Pope's famous verse, "The wisest, brightest, meanest of mankind," may be disputed in all its three specifications. Bacon's treatment of Essex, which formerly called forth such bitter condemnation, has been, I think, completely justified; and as for the taking of bribes, which led to his disgrace, there were circumstances which ought largely to mitigate the severity of our judgment. But if Bacon was far from being a mean example of human nature, it is surely an exaggeration to call him the wisest and brightest of mankind. He was a scholar and critic of vast accomplishments, a writer of noble English prose, and a philosopher who represented rather than inaugurated a most beneficial revolution in the aims and methods of scientific inquiry. He is one of the real glories of English literature, but he is also one of the most overrated men of modern times. When we find Macaulay saying that Bacon had "the most exquisitely constructed intellect that has ever been bestowed on any of the children of men," we need not be surprised to find that his elaborate essay on Bacon is as false in its fundamental conception as it is inaccurate in details. For a long time it was one of the accepted commonplaces that Bacon inaugurated the method by which modern discoveries in physical science have been made. Early in the present century, such writers on the history of science as Whewell began to show the incorrectness of this notion, and it was completely exploded by Stanley Jevons in his "Principles of Science," the most profound treatise on method that has appeared in the last fifty years. Jevons writes: "It is wholly a mistake to say that modern science is the result of the Baconian philosophy; it is

the Newtonian philosophy and the Newtonian method which have led to all the great triumphs of physical science, and ... the 'Principia' forms the true Novum Organon." This statement of Jevons is thoroughly sound. The great Harvey, who knew how scientific discoveries are made, said with gentle sarcasm that Bacon "wrote philosophy like a lord chancellor;" yet Harvey would not have denied that the chancellor was doing noble service as the eloquent expounder of many sides of the scientific movement that was then gathering strength. Bacons mind was eminently sagacious and fertile in suggestions, but the supreme creative faculty, the power to lead men into new paths, was precisely the thing which he did not possess. His place is a very high one among intellects of the second order; but to rank him with such godlike spirits as Newton, Spinoza, and Leibnitz simply shows that one has no real knowledge of the work which such men have done.

So much for Bacon himself. With regard to him as possible author of the Shakespeare poems and plays, it is difficult to imagine so learned a scholar making the kind of mistakes that abound in those writings. Bacon would hardly have introduced clocks into the Rome of Julius Cæsar; nor would he have made Hector quote Aristotle, nor Hamlet study at the University of Wittenberg, founded five hundred years after Hamlet's time; nor would he have put pistols into the age of Henry IV., nor cannon into the age of King John; and we may be pretty sure that he would not have made one of the characters in "King Lear" talk about Turks and Bedlam. In this severely realistic age of ours, writers are more on their guard against such anachronisms than they were in Shakespeare's time; in his works we cannot call them serious blemishes, for they do not affect the artistic character of the plays, but they are certainly such mistakes as a scholar like Bacon would not have committed.

Deeper down lies the contrast involved in the fact that Bacon was in a high degree a subjective writer, from whom you are perpetually getting revelations of his idiosyncrasies and moods, whereas of all writers in the world Shakespeare is the most completely objective, the most absorbed in the work of creation. In the one writer you are always reminded of the man Bacon; in the other the

personality is never thrust into sight. Bacon is highly self-conscious; from Shakespeare self-consciousness is absent.

The contrast is equally great in respect of humour. I would not deny that Bacon relished a joke, or could perpetrate a pun; but the bubbling, seething, frolicsome, irrepressible drollery of Shakespeare is something quite foreign to him. Read his essays, and you get charming English, wide knowledge, deep thought, keen observation, worldly wisdom, good humour, sweet serenity; but exuberant fun is not there. In writing these essays Bacon was following an example set by Montaigne, but, as contrasted with the delicate effervescent humour of the Frenchman, his style seems sober and almost insipid. Only fancy such a man trying to write "The Merry Wives of Windsor"!

Both Shakespeare and Bacon were sturdy and rapacious purloiners. They seized upon other men's bright thoughts and made them their own without compunction and without acknowledgment; and this may account for sundry similarities which may be culled from the plays and from Bacon's works, upon which Baconizing text-mongers are wont to lay great stress as proof of common authorship. Some such resemblances may be due to borrowing from common sources; others are doubtless purely fanciful; others indicate either that Shakespeare cribbed from Bacon or *vice versa*. Here are a few miscellaneous instances: —

Where Bacon says, "Be so true to thyself as thou be not false to others" ("Essay of Wisdom"), Shakespeare says: —

"To thine own self be true, And it must follow, as the night the day, Thou canst not then be false to any man."

(Hamlet, I. iii.)

This looks as if one writer might have copied from the other. If so, it is Bacon who is the thief, for the lines occur in the quarto "Hamlet" published in 1603, whereas the "Essay of Wisdom" was first published in 1612.

Again, where Bacon, in the "Essay of Gardens," says, "The breath of flowers comes and goes like the warbling of music," it reminds one strongly of the exquisite passage in "Twelfth Night" where the Duke exclaims: —

“That strain again! it had a dying fall: O, it came o’er my ear like the sweet south, That breathes upon a bank of violets, Stealing and giving odour.”

I have little doubt that Bacon had this passage in mind when he wrote the “Essay of Gardens,” which was first published in 1625, two years later than the complete folio of Shakespeare. This effectually disposes of the attempt to cite these correspondences in evidence that Bacon wrote the plays.

Another instance is from “Richard III.:” —

“By a divine instinct men’s minds mistrust Ensuing danger; as, by proof, we see The waters swell before a boisterous storm.”

Bacon, in the “Essay of Sedition,” writes, “As there are ... secret swellings of seas before a tempest, so there are in states.” But this essay was not published till 1625, so again we find him copying Shakespeare. Many such “parallelisms,” cited to prove that Bacon wrote Shakespeare’s works, do really prove that he read them with great care and remembered them well, or else took notes from them.

An interesting illustration of the helpless ignorance shown by Baconizers is furnished by a remark of Sir Toby Belch in “Twelfth Night.” In his instructions to that dear old simpleton, Sir Andrew Aguecheek, about the challenge, Sir Toby observes, “If thou thou’st him some thrice, it shall not be amiss.” In Elizabethan English, to address a man as “thou” was to treat him as socially inferior; such familiarity was allowable only between members of the same family or in speaking to servants, just as you address your wife, and likewise the cook and housemaid, by their Christian names, while with the ladies of your acquaintance such familiarity would be rudeness. The same rule for the pronoun survives to-day in French and German, but has been forgotten in English. In the trial of Sir Walter Raleigh in 1604, Justice Coke insulted the prisoner by calling out, “Thou viper! for I *thou* thee, thou traitor!” Now, one of our Baconizers thinks that his idol, in writing “Twelfth Night,” introduced Sir Toby’s suggestion in order to recall to the audience Coke’s abusive remark. Once more, a little attention to dates would have prevented the making of a bad blunder. We know from Manningham’s Diary that “Twelfth Night” had been on the stage nearly two

years before Raleigh's trial. On the other hand, to say that the play might have suggested to Coke his coarse speech would be admissible, but idle, inasmuch as the expression "to *thou* a man" was an every-day phrase in that age.

Here it naturally occurs to me to mention the "Promus," about which as much fuss has been made as if it really furnished evidence in support of the Baconian folly. There is in the British Museum a manuscript, in Bacon's handwriting, entitled "Promus of Formularies and Elegancies." "Promus" means "storehouse" or "treasury." A date at the top of the first page shows that it was begun in December, 1594; there is nothing, I believe, to show over how many years it extended. It is a scrap-book in which Bacon jotted down such sentences, words, and phrases as struck his fancy, such as might be utilized in his writings. These neatly turned phrases, these "formularies and elegancies," are gathered from all quarters, — from the Bible, from Virgil and Horace, from Ovid and Seneca, from Erasmus, from collections of proverbs in various languages, *etc.* As there is apparently nothing original in this scrap-bag, Mr. Spedding did not think it worth while to include it in his edition of Bacon's works, but in the fourteenth volume he gives a sufficient description of it, with illustrative extracts. In 1883 Mrs. Henry Pott published the whole of this "Promus" manuscript, and swelled it by comments and dissertations into a volume of 600 octavo pages. She had found in it several hundred expressions which reminded her of passages in Shakespeare, and so it confirmed her in the opinion which she already entertained that Bacon was the author of Shakespeare's works. Thus, when the "Promus" has a verse from Ovid, which means, "And the forced tongue begins to lisp the sound commanded," it reminds Mrs. Pott of divers lines in which Shakespeare uses the word "lisp," as for example, in "As You Like It," "you lisp and wear strange suits;" and she jumps to the conclusion that when Bacon jotted down the verse from Ovid, it was as a preparatory study toward "As You Like It," and any other play that contains the word "lisp:" therefore Bacon wrote all those plays, *Q. E. D.*! On the next page we find Virgil's remark, "Thus was I wont to compare great things with small," made the father of Falstaff's "base comparisons," and Fluellen's "Macedon and Monmouth," as well as honest Dogberry's

"comparisons are odorous." When one reads such things, evidently printed in all seriousness, one feels like asking Mrs. Pott, in the apt words of Shakespeare's friend Fletcher, "What mare's nest hast thou found?" ("Bonduca," V. ii.)

There are many phrases, however, in the "Promus" which undoubtedly agree with phrases in the plays. They show that Bacon heard or read the plays with great interest, and culled from them his "elegancies" with no stinted hand. As for Mrs. Pott's bulky volume, it brings us so near to the final *reductio ad absurdum* of the Bacon theory that we hardly need spend many words upon the gross improbabilities which that theory involves. The plays of Shakespeare were universally ascribed to him by his contemporaries; many of them were published during his lifetime with his name upon the title-page as the author; all were collected and published together by Hemminge and Condell, two of his fellow actors, seven years after his death; and for more than two centuries nobody ever dreamed of looking for a different authorship, or of associating the plays with Bacon. But this Chimborazo of *prima facie* evidence becomes a mere mole-hill in the hands of your valiant Baconizer. It is all clear to him. Bacon did not acknowledge the authorship of these works because such literature was deemed frivolous, and current prejudices against theatres and playwrights might injure his hopes of advancement at the bar and in political life. Therefore, by some sort of private understanding with the ignorant and sordid wretch Shakespeare, at whose theatre they were brought out, their authorship was ascribed to him, the real author died without revealing the secret, and the whole world was deceived until the days of Delia Bacon.

But there are questions which even this ingenious hypothesis fails to answer. Why should Bacon have taken the time to write those thirty-seven plays, two poems, and one hundred and fifty-four sonnets, if they were never to be known as his works? Not for money, surely, for that grasping Shakespeare seems to have got the money as well as the fame; Bacon died a poor man. His principal aim in life was to construct a new system of philosophy; on this noble undertaking he spent such time as he could save from the exactions of his public

career as member of Parliament, chancery lawyer, solicitor-general, attorney-general, lord chancellor; and he died with this work far from finished. The volumes which he left behind him were only fragments of the mighty structure which he had planned. We may well ask, Where did this overburdened writer find the time for doing work of another kind voluminous enough to fill a lifetime, and what motive had he for doing it without recompense in either fame or money? Baconizers find it strange that Shakespeare's will contains no reference to his plays as literary property. The omission is certainly interesting, since it seems to indicate that he had parted with his pecuniary interest in them, — had perhaps sold it out to the Globe Theatre. If this omission can be held to show that Shakespeare was lacking in fondness for the productions of his own genius, what shall be said of the notion that Bacon spent half his life in writing works the paternity of which he must forever disown?

This question is answered by Mr. Ignatius Donnelly, a writer who speculates with equal infelicity on all subjects, but never suffers for lack of boldness. He published in 1887 a book even bigger than that of Mrs. Pott, for it has nearly 1000 pages. Its title is, "The Great Cryptogram," and its thesis is, that Bacon really did claim the authorship of the Shakespeare plays. Only the claim was made in a cipher, and if you simply make some numbers mean some words, and other words mean other numbers, and perform a good many sums in what the Mock Turtle called "ambition, distraction, uglification, and derision," you will be able to read this claim between the lines, along with much other wonderful information. Thus does the arithmetical Donnelly carry us quite a long stride nearer to the *reductio ad absurdum*, or suicide point, than we were left by Mrs. Pott, with her lisping and limping comparisons.

But before we come to the jumping-off place, let us pause for a moment and take a retrospective glance at the natural history of the Bacon-Shakespeare craze. What was it that first unlocked the sluice-gates, and poured forth such a deluge of foolishness upon a sorely suffering world? It will hardly do to lay the blame upon poor Delia Bacon. Her suggestions would have borne no fruit had they not found a public, albeit a narrow one, in some degree prepared for them. Who,

then, prepared the soil for the seeds of this idiocy to take root? Who but the race of fond and foolish Shakespeare commentators, with their absurd claims for their idol? During the eighteenth century Shakespeare was generally underrated. Voltaire wondered how a nation that possessed such a noble tragedy as Addison's "Cato" could endure such plays as "Hamlet" and "Othello." In the days of Scott and Burns a reaction set in; and Shakespeare worship reached its height when the Germans took it up, and, not satisfied with calling him the prince of poets and peerless master of dramatic art, began to discover in his works all sorts of hidden philosophy and impossible knowledge. Of the average German mind Lowell good-naturedly says that "it finds its keenest pleasure in divining a profound significance in the most trifling things, and the number of mare's nests that have been stared into by the German *Gelehrter* through his spectacles passes calculation." But the Germans are not the only sinners; let me cite an instance from near home. In the quarto "Hamlet" of 1603 we read: —

"Full forty years are past, their date is gone, Since happy time joined both our hearts as one: And now the blood that filled my youthful veins Runs weakly in their pipes," *etc.*

Whereupon Mr. Edward Vining calls upon us to observe how Shakespeare, "to whom all human knowledge seems to be but a matter of instinct, in [these lines] asserts the circulation of the blood in the veins and 'pipes,' a truth which Harvey probably did not even suspect until at least thirteen years later," *etc.* Does Mr. Vining really suppose that what Harvey did was to discover that blood runs in our veins? A little further study of history would have taught him that even the ancients knew that blood runs in the veins. About fourteen hundred years before "Hamlet" was written, Galen proved that it also runs in the arteries. After Galen's time, it was believed that the dark blood nourishes such plebeian organs as the liver, while the bright blood nourishes such lordly organs as the brain, and that the interchange takes place in the heart; until the sixteenth century, when Vesalius proved that the interchange does not take place in the heart, and the martyr Servetus proved that it does take place in the lungs; and so on till 1619, when Harvey discovered that dark blood is brought by the veins to

the right side of the heart, and thence driven into the lungs, where it becomes bright and flows into the left side of the heart, thence to be propelled throughout the body in the arteries. That it then grows dark and returns through the veins Harvey believed, but no one could tell how, until, forty years later, Malpighi with his microscope detected the capillaries. Now to talk about Shakespeare discerning as if by instinct a truth which Harvey afterward discovered is simply silly. Instead of showing rare scientific knowledge, his remark about blood running in the veins is one that anybody might have made.

This is a fair specimen of the ignorant way in which doting commentators have built up an impossible Shakespeare, until at last they have provoked a reaction. Sooner or later the question was sure to arise, Where did your Stratford boy get all this abstruse scientific knowledge? The keynote was perhaps first sounded by August von Schlegel, who persuaded himself that Shakespeare had mastered "all the things and relations of this world," and then went on to declare that the accepted account of his life must be a mere fable. Thus we reach the point from which Delia Bacon started.

It may safely be said that all theories of Shakespeare's plays which suppose them to be attempts at teaching occult philosophical doctrines, or which endow them with any other meanings than those which their words directly and plainly convey, are a delusion and a snare. Those plays were written, not to teach philosophy, but to fill the theatre and make money. They were written by a practised actor and manager, the most consummate master of dramatic effects that ever lived; a poet unsurpassed for fertility of invention, unequalled for melody of language, unapproached for delicacy of fancy, inexhaustible in humour, profoundest of moralists; a man who knew human nature by intuition, as Mozart knew counterpoint or as Chopin knew harmony. The name of that writer was none other than William Shakespeare of Stratford-on-Avon.

It was inevitable that the Bacon folly, after once adopting such methods as those of Mrs. Pott and Mr. Donnelly, should proceed to commit suicide by piling up extravagances. By such methods one can prove anything, and accordingly we

find these writers busy in tracing Bacon's hand in the writings of Greene, Marlowe, Shirley, Marston, Massinger, Middleton, and Webster. They are sure that he was the author of Montaigne's Essays, which were afterward translated into what we have always supposed to be the French original. Mr. Donnelly believes that Bacon also wrote Burton's "Anatomy of Melancholy." Next comes Dr. Orville Owen with a new cipher, which proves that Bacon was the son of Queen Elizabeth by Robert Dudley, and that he was the author of the "Faerie Queene" and other poems attributed to Edmund Spenser. Finally we have Mr. J. E. Roe, who does not mean to be outdone. He asks us what we are to think of the notion that an ignorant tinker, like John Bunyan, could have written the most perfect allegory in any language. Perish the thought! Nobody but Bacon could have done it. Of course Bacon had been more than fifty years in his grave when "Pilgrim's Progress" was published as Bunyan's. But your true Baconizer is never stopped by trifles. Mr. Roe assures us that Bacon wrote that heavenly book, as well as "Robinson Crusoe" and the "Tale of a Tub;" which surely begins to make him seem ubiquitous and everlasting. If things go on at this rate, we shall presently have a religious sect holding as its first article of faith that Francis Bacon created the heavens and the earth in six days, and rested on the seventh day.

November, 1896.

The Classification of the Sciences — Francis Bacon by Walter Libby

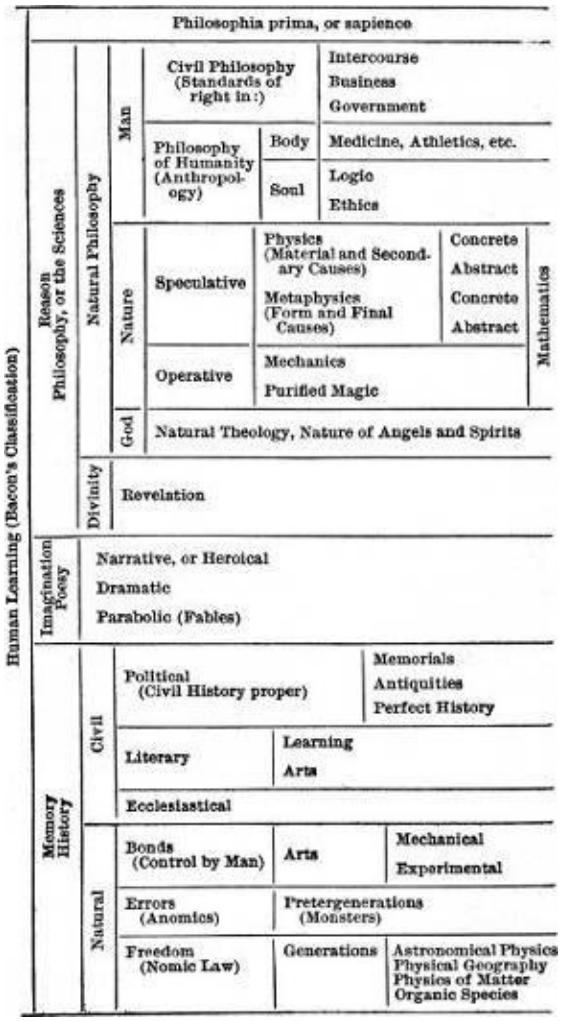
From 'An Introduction to the History of Science'

The preceding chapter has shown that there is a continuity in the development of single sciences. The astronomy, or the chemistry, or the mathematics, of one period depends so directly on the respective science of the foregoing period, that one feels justified in using the term "growth," or "evolution," to describe their progress. Now a vital relationship can be observed not only among different stages of the same science, but also among the different sciences. Physics, astronomy, and chemistry have much in common; geometry, trigonometry, arithmetic, and algebra are called "branches" of mathematics; zoölogy and botany are biological sciences, as having to do with living species. In the century following the death of Copernicus, two great scientists, Bacon and Descartes, compared all knowledge to a tree, of which the separate sciences are branches. They thought of all knowledge as a living organism with an interconnection or continuity of parts, and a capability of growth.

By the beginning of the seventeenth century the sciences were so considerable that in the interest of further progress a comprehensive view of the tree of knowledge, a survey of the field of learning, was needed. The task of making this survey was undertaken by Francis Bacon, Lord Verulam (1561-1626). His classification of human knowledge was celebrated, and very influential in the progress of science. He kept one clear purpose in view, namely, the control of nature by man. He wished to take stock of what had already been accomplished, to supply deficiencies, and to enlarge the bounds of human empire. He was acutely conscious that this was an enterprise too great for any one man, and he used his utmost endeavors to induce James I to become the patron of the plan. His project admits of very simple statement now; he wished

to edit an encyclopedia, but feared that it might prove impossible without coöperation and without state support. He felt capable of furnishing the plans for the building, but thought it a hardship that he was compelled to serve both as architect and laborer. The worthiness of these plans was attested in the middle of the eighteenth century, when the great French *Encyclopaedia* was projected by Diderot and D'Alembert. The former, its chief editor and contributor, wrote in the Prospectus: "If we come out successful from this vast undertaking, we shall owe it mainly to Chancellor Bacon, who sketched the plan of a universal dictionary of sciences and arts at a time when there were not, so to speak, either arts or sciences. This extraordinary genius, when it was impossible to write a history of what men knew, wrote one of what they had to learn."

Bacon, as we shall amply see, was a firm believer in the study of the arts and occupations, and at the same time retained his devotion to principles and abstract thought. He knew that philosophy could aid the arts that supply daily needs; also that the arts and occupations enriched the field of philosophy, and that the basis of our generalizations must be the universe of things knowable. "For," he writes, "if men judge that learning should be referred to use and action, they judge well; but it is easy in this to fall into the error pointed out in the ancient fable; in which the other parts of the body found fault with the stomach, because it neither performed the office of motion as the limbs do, nor of sense, as the head does; but yet notwithstanding it is the stomach which digests and distributes the aliment to all the rest. So that if any man think that philosophy and universality are idle and unprofitable studies, he does not consider that all arts and professions are from thence supplied with sap and strength." For Bacon, as for Descartes, natural philosophy was the trunk of the tree of knowledge.



Human Learning (Bacon's Classification)
Philosophia prima, or sapience
Reason
Philosophy, or the Sciences
Natural Philosophy
Man
Civil Philosophy (Standards of right in:)
Intercourse
Business
Government
Philosophy of Humanity (Anthropology)
Body
Medicine, Athletics, etc.
Soul
Logic
Ethics
Nature
Speculative
Physics (Material and Secondary Causes)
Concrete
Abstract
Metaphysics (Form and Final Causes)
Concrete
Abstract
Mathematics
Operative
Mechanics
Purified Magic
God
Natural Theology, Nature of Angels and Spirits
Divinity
Revelation
Imagination
Poesy
Narrative, or Heroical
Dramatic
Parabolic (Fables)
Memory
History
Civil
Political (Civil History proper)
Memorials
Antiquities
Perfect History

Learning
Arts
Ecclesiastical
Natural
Bonds (Control by Man)
Arts
Mechanical
Experimental
Errors (Anomics)
Pretergenerations (Monsters)
Freedom (Nomic Law)
Generations
Astronomical Physics
Physical Geography
Physics of Matter
Organic Species

	Knowledge Classified (Hugo of St. Victor, d. 1141).	
Theoretical	Theology Natural Philosophy (Physic)	
	Mathematics	Arithmetic Music (study of harmony) Geometry Astronomy
Practical (Moral)	Ethics, or individual morality Economics, or family morality Politics, or civics	
Mechanical	Weaving, spinning, sewing; work in wool, flax, etc. Equipment—arms, ships; work in stone, wood, metal Navigation Agriculture Hunting, fishing, foods Medicine Theatricals—drama, music, athletics, etc.	
Logical	Oratory Grammar Dialectic Rhetoric	

On the other hand, he looked to the arts, crafts, and occupations as a source of scientific principles. In his survey of learning he found some records of agriculture and likewise of many mechanical arts. Some think them a kind of dishonor. “But if my judgment be of any weight, the use of History Mechanical is, of all others, the most radical and fundamental towards natural philosophy.” When the different arts are known, the senses will furnish sufficient concrete material for the information of the understanding. The record of the arts is of most use because it exhibits things in motion, and leads more directly to practice. “Upon this history, therefore, mechanical and illiberal as it may seem (all fineness and daintiness set aside), the greatest diligence must be bestowed.” “Again, among the particular arts those are to be preferred which exhibit, alter, and prepare natural bodies and materials of things as agriculture, cooking,

chemistry, dyeing; the manufacture of glass, enamel, sugar, gunpowder, artificial fires, paper and the like." Weaving, carpentry, architecture, manufacture of mills, clocks, *etc.* follow. The purpose is not solely to bring the arts to perfection, but all mechanical experiments should be as streams flowing from all sides into the sea of philosophy.

Shortly after James I came to the throne in 1603, Bacon published his *Advancement of Learning*. He continued in other writings, however, to develop the organization of knowledge, and in 1623 summed up his plan in the *De Augmentis Scientiarum*.

A recent writer (Pearson, 1900) has attempted to summarize Bacon's classification of the different branches of learning. When one compares this summary with an outline of the classification of knowledge made by the French monk, Hugo of St. Victor, who stands midway between Isidore of Seville (570-636) and Bacon, some points of resemblance are of course obvious. Moreover, Hugo, like Bacon, insisted on the importance of not being narrowly utilitarian. Men, he says, are often accustomed to value knowledge not on its own account but for what it yields. Thus it is with the arts of husbandry, weaving, painting, and the like, where skill is considered absolutely vain, unless it results in some useful product. If, however, we judged after this fashion of God's wisdom, then, no doubt, the creation would be preferred to the Creator. But wisdom is life, and the love of wisdom is the joy of life (*felicitas vitæ*).

Nevertheless, when we compare these classifications diligently, we find very marked differences between Bacon's views and the medieval. The weakest part of Hugo's classification is that which deals with natural philosophy. *Physica*, he says, undertakes the investigation of the causes of things in their effects, and of effects in their causes. It deals with the explanation of earthquakes, tides, the virtues of plants, the fierce instincts of wild animals, every species of stone, shrub, and reptile. When we turn to his special work, however, on this branch of knowledge, *Concerning Beasts and Other Things*, we find no attempt to subdivide the field of *physica*, but a series of details in botany, geology, zoölogy, and human anatomy, mostly arranged in dictionary form.

When we refer to Bacon's classification we find that Physics corresponds to Hugo's *Physica*. It studies natural phenomena in relation to their material causes. For this study, Natural History, according to Bacon, supplies the facts. Let us glance, then, at his work on natural history, and see how far he had advanced from the medieval toward the modern conception of the sciences.

For purposes of scientific study he divided the phenomena of the universe into (1) Celestial phenomena; (2) Atmosphere; (3) Globe; (4) Substance of earth, air, fire, water; (5) Genera, species, *etc.* Great scope is given to the natural history of man. The arts are classified as *nature modified by man*. *History* means, of course, descriptive science.

Bacon's Catalogue of Particular Histories by Titles (1620) 1. History of the Heavenly Bodies; or Astronomical History.

2. History of the Configuration of the Heavens and the parts thereof towards the Earth and the parts thereof; or Cosmographical History.

3. History of Comets.

4. History of Fiery Meteors.

5. History of Lightnings, Thunderbolts, Thunders, and Coruscations.

6. History of Winds and Sudden Blasts and Undulations of the Air.

7. History of Rainbows.

8. History of Clouds, as they are seen above.

9. History of the Blue Expanse, of Twilight, of Mock-Suns, Mock-Moons, Haloes, various colours of the Sun; and of every variety in the aspect of the heavens caused by the medium.

10. History of Showers, Ordinary, Stormy, and Prodigious; also of Waterspouts (as they are called); and the like.

11. History of Hail, Snow, Frost, Hoar-frost, Fog, Dew, and the like.

12. History of all other things that fall or descend from above, and that are generated in the upper region.

13. History of Sounds in the upper region (if there be any), besides Thunder.

14. History of Air as a whole, or in the Configuration of the World.

15. History of the Seasons or Temperatures of the Year, as well according to the variations of Regions as according to accidents of Times and Periods of Years; of Floods, Heats, Droughts, and the like.

16. History of Earth and Sea; of the Shape and Compass of them, and their Configurations compared with each other; and of their broadening or narrowing; of Islands in the Sea; of Gulfs of the Sea, and Salt Lakes within the Land; Isthmuses and Promontories.

17. History of the Motions (if any be) of the Globe of Earth and Sea; and of the Experiments from which such motions may be collected.

18. History of the greater motions and Perturbations in Earth and Sea; Earthquakes, Tremblings and Yawnings of the Earth, Islands newly appearing; Floating Islands; Breakings off of Land by entrance of the Sea, Encroachments and Inundations and contrariwise Recessions of the Sea; Eruptions of Fire from the Earth; Sudden Eruptions of Waters from the Earth; and the like.

19. Natural History of Geography; of Mountains, Vallies, Woods, Plains, Sands, Marshes, Lakes, Rivers, Torrents, Springs, and every variety of their course, and the like; leaving apart Nations, Provinces, Cities, and such like matters pertaining to Civil life.

20. History of Ebbs and Flows of the Sea; Currents, Undulations, and other Motions of the Sea.

21. History of other Accidents of the Sea; its Saltness, its various Colours, its Depth; also of Rocks, Mountains, and Vallies under the Sea, and the like.

Next come Histories of the Greater Masses 22. History of Flame and of things Ignited.

23. History of Air, in Substance, not in the Configuration of the World.

24. History of Water, in Substance, not in the Configuration of the World.

25. History of the Earth and the diversity thereof, in Substance, not in the Configuration of the World.

Next come Histories of Species

26. History of perfect Metals, Gold, Silver; and of the Mines, Veins, Marcasites of the same; also of the Working in the Mines.

27. History of Quicksilver.

28. History of Fossils; as Vitriol, Sulphur, *etc.*

29. History of Gems; as the Diamond, the Ruby, *etc.*

30. History of Stones; as Marble, Touchstone, Flint, *etc.*

31. History of the Magnet.

32. History of Miscellaneous Bodies, which are neither entirely Fossil nor Vegetable; as Salts, Amber, Ambergris, *etc.*

33. Chemical History of Metals and Minerals.

33. Chemical History of Metals and Minerals.

34. History of Plants, Trees, Shrubs, Herbs; and of their parts, Roots, Stalks, Wood, Leaves, Flowers, Fruits, Seeds, Gums, *etc.*

35. Chemical History of Vegetables.

36. History of Fishes, and the Parts and Generation of them.

37. History of Birds, and the Parts and Generation of them.

38. History of Quadrupeds, and the Parts and Generation of them.

39. History of Serpents, Worms, Flies, and other insects; and of the Parts and Generation of them.

40. Chemical History of the things which are taken by Animals.

Next come Histories of Man

41. History of the Figure and External Limbs of man, his Stature, Frame, Countenance, and Features; and of the variety of the same according to Races and Climates, or other smaller differences.

42. Physiognomical History of the same.

43. Anatomical History, or of the Internal Members of Man; and of the variety of them, as it is found in the Natural Frame and Structure, and not merely as regards Diseases and Accidents out of the course of Nature.

44. History of the parts of Uniform Structure in Man; as Flesh, Bones, Membranes, *etc.*

45. History of Humours in Man; Blood, Bile, Seed, *etc.*

46. History of Excrements; Spittle, Urine, Sweats, Stools, Hair of the Head,

Hairs of the Body, Whitlows, Nails, and the like.

47. History of Faculties; Attraction, Digestion, Retention, Expulsion, Sanguification, Assimilation of Aliment into the members, conversion of Blood and Flower of Blood into Spirit, *etc.*

48. History of Natural and Involuntary Motions; as Motion of the Heart, the Pulses, Sneezing, Lungs, Erection, *etc.*

49. History of Motions partly Natural and Partly Violent; as of Respiration, Cough, Urine, Stool, *etc.*

50. History of Voluntary Motions; as of the Instruments of Articulation of Words; Motions of the Eyes, Tongue, Jaws, Hands, Fingers; of Swallowing, *etc.*

51. History of Sleep and Dreams.

52. History of different habits of Body — Fat, Lean; of the Complexions (as they call them), *etc.*

53. History of the Generation of Man.

54. History of Conception, Vivification, Gestation in the Womb, Birth, *etc.*

55. History of the Food of Man; and of all things Eatable and Drinkable; and of all Diet; and of the variety of the same according to nations and smaller differences.

56. History of the Growth and Increase of the Body, in the whole and in its parts.

57. History of the Course of Age; Infancy, Boyhood, Youth, Old Age; of Length and Shortness of Life, and the like, according to nations and lesser differences.

58. History of Life and Death.

59. History Medicinal of Diseases, and of the Symptoms and Signs of them.

60. History Medicinal of the Treatment and Remedies and Cures of Diseases.

61. History Medicinal of those things which preserve the Body and the Health.

62. History Medicinal of those things which relate to the Form and Comeliness of the Body.

63. History Medicinal of those things which alter the Body, and pertain to Alterative Regimen.

64. History of Drugs.

65. History of Surgery.

66. Chemical History of Medicines.

67. History of Vision, and of things Visible.

68. History of Painting, Sculpture, Modelling, *etc.*

69. History of Hearing and Sound.

70. History of Music.

71. History of Smell and Smells.

72. History of Taste and Tastes.

73. History of Touch, and the objects of Touch.

74. History of Venus, as a species of Touch.

75. History of Bodily Pains, as species of Touch.

76. History of Pleasure and Pain in general.

76. History of Pleasure and Pain in general.

77. History of the Affections; as Anger, Love, Shame, *etc.*

78. History of the Intellectual Faculties; Reflexion, Imagination, Discourse, Memory, *etc.*

79. History of Natural Divinations.

80. History of Diagnostics, or Secret Natural Judgements.

81. History of Cookery, and of the arts thereto belonging, as of the Butcher, Poulterer, *etc.*

82. History of Baking, and the Making of Bread, and the arts thereto belonging, as of the Miller, *etc.*

83. History of Wine.

84. History of the Cellar and of different kinds of Drink.

85. History of Sweetmeats and Confections.

86. History of Honey.

87. History of Sugar.

88. History of the Dairy.

89. History of Baths and Ointments.

90. Miscellaneous History concerning the care of the body — as of Barbers, Perfumers, *etc.*

91. History of the working of Gold, and the arts thereto belonging.

92. History of the manufactures of Wool, and the arts thereto belonging.

92. History of the manufactures of Wool, and the arts thereto belonging.

93. History of the manufactures of Silk, and the arts thereto belonging.

94. History of the manufactures of Flax, Hemp, Cotton, Hair, and other kinds of Thread, and the arts thereto belonging.

95. History of manufactures of Feathers.

96. History of Weaving, and the arts thereto belonging.

97. History of Dyeing.

98. History of Leather-making, Tanning, and the arts thereto belonging.

99. History of Ticking and Feathers.

100. History of working in Iron.

101. History of Stone-cutting.

102. History of the making of Bricks and Tiles.

103. History of Pottery.

104. History of Cements, *etc.*

105. History of working in Wood.

106. History of working in Lead.

107. History of Glass and all vitreous substances, and of Glass-making.

108. History of Architecture generally.

109. History of Waggons, Chariots, Litters, *etc.*

110. History of Printing, of Books, of Writing, of Sealing; of Ink, Pen, Paper, Parchment, *etc.*

111. History of Wax.

112. History of Basket-making.

113. History of Mat-making, and of manufactures of Straw, Rushes, and the like.

114. History of Washing, Scouring, *etc.*

115. History of Agriculture, Pasturage, Culture of Woods, *etc.*

116. History of Gardening.

117. History of Fishing.

118. History of Hunting and Fowling.

119. History of the Art of War, and of the arts thereto belonging, as Armoury, Bow-making, Arrow-making, Musketry, Ordnance, Cross-bows, Machines, *etc.*

120. History of the Art of Navigation, and of the crafts and arts thereto belonging.

121. History of Athletics and Human Exercises of all kinds.

122. History of Horsemanship.

123. History of Games of all kinds.

124. History of Jugglers and Mountebanks.

125. Miscellaneous History of various Artificial Materials, — Enamel, Porcelain, various cements, *etc.*

126. History of Salts.

127. Miscellaneous History of various Machines and Motions.

128. Miscellaneous History of Common Experiments which have not grown into an Art.

Histories must also be written of Pure Mathematics; though they are rather observations than experiments 129. History of the Natures and Powers of Numbers.

130. History of the Natures and Powers of Figures.

The fragment containing this catalogue (*Parasceve* — Day of Preparation) was added to Bacon's work on method, *The New Logic* (*Novum Organum*), 1620. Besides completing his survey and classification of the sciences (*De Augmentis Scientiarum*), 1623, he published a few separate writings on topics in the catalogue — *Winds*, *Life and Death*, *Tides*, *etc.* In 1627, a year after his death, appeared his much misunderstood work, *Sylva Sylvarum*. He had found that the Latin word *sylva* meant *stuff* or *raw material*, as well as a *wood*, and called this final work *Sylva Sylvarum*, which I would translate, "Jungle of Raw Material." He himself referred to it as "an undigested heap of particulars"; yet he was willing it should be published because "he preferred the good of men to anything that might have relation to himself." In it, following his catalogue, he fulfilled the promise made in 1620, of putting nature and the arts to question. Some of the problems suggested for investigation are: congealing of air, turning air into water, the secret nature of flame, motion of gravity, production of cold, nourishing of young creatures in the egg or womb, prolongation of life, the media of sound, infectious diseases, accelerating and preventing putrefaction, accelerating and staying growth, producing fruit without core or seed, production of composts and helps for ground, flying in the air.

In the *New Atlantis*, a work of imagination, Bacon had represented as already achieved for mankind some of the benefits he wished for: artificial metals, various cements, excellent dyes, animals for vivisection and medical experiment, instruments which generate heat solely by motion, artificial precious stones, conveyance of sound for great distances and in tortuous lines, new explosives. "We imitate," says the guide in the Utopian land, "also flights of birds; we have some degree of flying in the air; we have ships and boats for going under water." Bacon believed in honoring the great discoverers and inventors, and advocated maintaining a calendar of inventions.

He was a fertile and stimulating thinker, and much of his great influence arose from the comprehensiveness that led to his celebrated classification of the sciences.

PREFACE.

In preparing this sketch it is needless to say how deeply I am indebted to Mr. Spedding and Mr. Ellis, the last editors of Bacon's writings, the very able and painstaking commentators, the one on Bacon's life, the other on his philosophy. It is impossible to overstate the affectionate care and high intelligence and honesty with which Mr. Spedding has brought together and arranged the materials for an estimate of Bacon's character. In the result, in spite of the force and ingenuity of much of his pleading, I find myself most reluctantly obliged to differ from him; it seems to me to be a case where the French saying, cited by Bacon in one of his commonplace books, holds good— "*Par trop se débattre, la vérité se perd*."[1] But this does not diminish the debt of gratitude which all who are interested about Bacon must owe to Mr. Spedding. I wish also to acknowledge the assistance which I have received from Mr. Gardiner's *History of England* and Mr. Fowler's edition of the *Novum Organum*; and not least from M. de Rémusat's work on Bacon, which seems to me the most complete and the most just estimate both of Bacon's character and work which has yet appeared; though even in this clear and dispassionate survey we are reminded by some misconceptions, strange in M. de Rémusat, how what one nation takes for granted is incomprehensible to its neighbour; and what a gap there is still, even in matters of philosophy and literature, between the whole Continent and ourselves — "Penitus toto divisos orbe Britannos."

CHAPTER I.

EARLY LIFE.

The life of Francis Bacon is one which it is a pain to write or to read. It is the life of a man endowed with as rare a combination of noble gifts as ever was bestowed on a human intellect; the life of one with whom the whole purpose of living and of every day's work was to do great things to enlighten and elevate his race, to enrich it with new powers, to lay up in store for all ages to come a source of blessings which should never fail or dry up; it was the life of a man who had high thoughts of the ends and methods of law and government, and with whom the general and public good was regarded as the standard by which the use of public power was to be measured; the life of a man who had struggled hard and successfully for the material prosperity and opulence which makes work easy and gives a man room and force for carrying out his purposes. All his life long his first and never-sleeping passion was the romantic and splendid ambition after knowledge, for the conquest of nature and for the service of man; gathering up in himself the spirit and longings and efforts of all discoverers and inventors of the arts, as they are symbolised in the mythical Prometheus. He rose to the highest place and honour; and yet that place and honour were but the fringe and adornment of all that made him great. It is difficult to imagine a grander and more magnificent career; and his name ranks among the few chosen examples of human achievement. And yet it was not only an unhappy life; it was a poor life. We expect that such an overwhelming weight of glory should be borne up by a character corresponding to it in strength and nobleness. But that is not what we find. No one ever had a greater idea of what he was made for, or was fired with a greater desire to devote himself to it. He was all this. And yet being all this, seeing deep into man's worth, his capacities, his greatness, his weakness, his sins, he was not true to what he knew. He cringed to such a man as Buckingham. He sold himself to the corrupt and ignominious Government of

James I. He was willing to be employed to hunt to death a friend like Essex, guilty, deeply guilty, to the State, but to Bacon the most loving and generous of benefactors. With his eyes open he gave himself up without resistance to a system unworthy of him; he would not see what was evil in it, and chose to call its evil good; and he was its first and most signal victim.

Bacon has been judged with merciless severity. But he has also been defended by an advocate whose name alone is almost a guarantee for the justness of the cause which he takes up, and the innocency of the client for whom he argues. Mr. Spedding devoted nearly a lifetime, and all the resources of a fine intellect and an earnest conviction, to make us revere as well as admire Bacon. But it is vain. It is vain to fight against the facts of his life: his words, his letters. "Men are made up," says a keen observer, "of professions, gifts, and talents; and also of *themselves*."[2] With all his greatness, his splendid genius, his magnificent ideas, his enthusiasm for truth, his passion to be the benefactor of his kind; with all the charm that made him loved by good and worthy friends, amiable, courteous, patient, delightful as a companion, ready to take any trouble — there was in Bacon's "self" a deep and fatal flaw. He was a pleaser of men. There was in him that subtle fault, noted and named both by philosophy and religion in the ἄρεσκος of Aristotle, the ἀνθρωπάρεσκος of St. Paul, which is more common than it is pleasant to think, even in good people, but which if it becomes dominant in a character is ruinous to truth and power. He was one of the men — there are many of them — who are unable to release their imagination from the impression of present and immediate power, face to face with themselves. It seems as if he carried into conduct the leading rule of his philosophy of nature, *parendo vincitur*. In both worlds, moral and physical, he felt himself encompassed by vast forces, irresistible by direct opposition. Men whom he wanted to bring round to his purposes were as strange, as refractory, as obstinate, as impenetrable as the phenomena of the natural world. It was no use attacking in front, and by a direct trial of strength, people like Elizabeth or Cecil or James; he might as well think of forcing some natural power in defiance of natural law. The first word of his teaching about nature is that she must be won

by observation of her tendencies and demands; the same radical disposition of temper reveals itself in his dealings with men: they, too, must be won by yielding to them, by adapting himself to their moods and ends; by spying into the drift of their humour, by subtly and pliantly falling in with it, by circuitous and indirect processes, the fruit of vigilance and patient thought. He thought to direct, while submitting apparently to be directed. But he mistook his strength. Nature and man are different powers, and under different laws. He chose to please man, and not to follow what his soul must have told him was the better way. He wanted, in his dealings with men, that sincerity on which he insisted so strongly in his dealings with nature and knowledge. And the ruin of a great life was the consequence.

Francis Bacon was born in London on the 22d of January, 1560/61, three years before Galileo. He was born at York House, in the Strand; the house which, though it belonged to the Archbishops of York, had been lately tenanted by Lord Keepers and Lord Chancellors, in which Bacon himself afterwards lived as Lord Chancellor, and which passed after his fall into the hands of the Duke of Buckingham, who has left his mark in the Water Gate which is now seen, far from the river, in the garden of the Thames Embankment. His father was Sir Nicholas Bacon, Elizabeth's first Lord Keeper, the fragment of whose effigy in the Crypt of St. Paul's is one of the few relics of the old Cathedral before the fire. His uncle by marriage was that William Cecil who was to be Lord Burghley. His mother, the sister of Lady Cecil, was one of the daughters of Sir Antony Cook, a person deep in the confidence of the reforming party, who had been tutor of Edward VI. She was a remarkable woman, highly accomplished after the fashion of the ladies of her party, and as would become her father's daughter and the austere and laborious family to which she belonged. She was "exquisitely skilled in the Greek and Latin tongues;" she was passionately religious, according to the uncompromising religion which the exiles had brought back with them from Geneva, Strasburg, and Zurich, and which saw in Calvin's theology a solution of all the difficulties, and in his discipline a remedy for all the evils, of mankind. This means that his boyhood from the first was

passed among the high places of the world — at one of the greatest crises of English history — in the very centre and focus of its agitations. He was brought up among the chiefs and leaders of the rising religion, in the houses of the greatest and most powerful persons of the State, and naturally, as their child, at times in the Court of the Queen, who joked with him, and called him "her young Lord Keeper." It means also that the religious atmosphere in which he was brought up was that of the nascent and aggressive Puritanism, which was not satisfied with the compromises of the Elizabethan Reformation, and which saw in the moral poverty and incapacity of many of its chiefs a proof against the great traditional system of the Church which Elizabeth was loath to part with, and which, in spite of all its present and inevitable shortcomings, her political sagacity taught her to reverence and trust.

At the age of twelve he was sent to Cambridge, and put under Whitgift at Trinity. It is a question which recurs continually to readers about those times and their precocious boys, what boys were then? For whatever was the learning of the universities, these boys took their place with men and consorted with them, sharing such knowledge as men had, and performing exercises and hearing lectures according to the standard of men. Grotius at eleven was the pupil and companion of Scaliger and the learned band of Leyden; at fourteen he was part of the company which went with the ambassadors of the States-General to Henry IV.; at sixteen he was called to the bar, he published an out-of-the-way Latin writer, Martianus Capella, with a learned commentary, and he was the correspondent of De Thou. When Bacon was hardly sixteen he was admitted to the Society of "Ancients" of Gray's Inn, and he went in the household of Sir Amyas Paulet, the Queen's Ambassador, to France. He thus spent two years in France, not in Paris alone, but at Blois, Tours, and Poitiers. If this was precocious, there is no indication that it was thought precocious. It only meant that clever and promising boys were earlier associated with men in important business than is customary now. The old and the young heads began to work together sooner. Perhaps they felt that there was less time to spare. In spite of

instances of longevity, life was shorter for the average of busy men, for the conditions of life were worse.

Two recollections only have been preserved of his early years. One is that, as he told his chaplain, Dr. Rawley, late in life, he had discovered, as far back as his Cambridge days, the "unfruitfulness" of Aristotle's method. It is easy to make too much of this. It is not uncommon for undergraduates to criticise their text-books; it was the fashion with clever men, as, for instance, Montaigne, to talk against Aristotle without knowing anything about him; it is not uncommon for men who have worked out a great idea to find traces of it, on precarious grounds, in their boyish thinking. Still, it is worth noting that Bacon himself believed that his fundamental quarrel with Aristotle had begun with the first efforts of thought, and that this is the one recollection remaining of his early tendency in speculation. The other is more trustworthy, and exhibits that inventiveness which was characteristic of his mind. He tells us in the *De Augmentis* that when he was in France he occupied himself with devising an improved system of cypher-writing — a thing of daily and indispensable use for rival statesmen and rival intriguers. But the investigation, with its call on the calculating and combining faculties, would also interest him, as an example of the discovery of new powers by the human mind.

In the beginning of 1579 Bacon, at eighteen, was called home by his father's death. This was a great blow to his prospects. His father had not accomplished what he had intended for him, and Francis Bacon was left with only a younger son's "narrow portion." What was worse, he lost one whose credit would have served him in high places. He entered on life, not as he might have expected, independent and with court favour on his side, but with his very livelihood to gain — a competitor at the bottom of the ladder for patronage and countenance. This great change in his fortunes told very unfavourably on his happiness, his usefulness, and, it must be added, on his character. He accepted it, indeed, manfully, and at once threw himself into the study of the law as the profession by which he was to live. But the law, though it was the only path open to him, was not the one which suited his genius, or his object in life. To the last he

worked hard and faithfully, but with doubtful reputation as to his success, and certainly against the grain. And this was not the worst. To make up for the loss of that start in life of which his father's untimely death had deprived him, he became, for almost the rest of his life, the most importunate and most untiring of suitors.

In 1579 or 1580 Bacon took up his abode at Gray's Inn, which for a long time was his home. He went through the various steps of his profession. He began, what he never discontinued, his earnest and humble appeals to his relative the great Lord Burghley, to employ him in the Queen's service, or to put him in some place of independence: through Lord Burghley's favour he seems to have been pushed on at his Inn, where, in 1586, he was a Bencher; and in 1584 he came into Parliament for Melcombe Regis. He took some small part in Parliament; but the only record of his speeches is contained in a surly note of Recorder Fleetwood, who writes as an old member might do of a young one talking nonsense. He sat again for Liverpool in the year of the Armada (1588), and his name begins to appear in the proceedings. These early years, we know, were busy ones. In them Bacon laid the foundation of his observations and judgments on men and affairs; and in them the great purpose and work of his life was conceived and shaped. But they are more obscure years than might have been expected in the case of a man of Bacon's genius and family, and of such eager and unconcealed desire to rise and be at work. No doubt he was often pinched in his means; his health was weak, and he was delicate and fastidious in his care of it. Plunged in work, he lived very much as a recluse in his chambers, and was thought to be reserved, and what those who disliked him called arrogant. But Bacon was ambitious — ambitious, in the first place, of the Queen's notice and favour. He was versatile, brilliant, courtly, besides being his father's son; and considering how rapidly bold and brilliant men were able to push their way and take the Queen's favour by storm, it seems strange that Bacon should have remained fixedly in the shade. Something must have kept him back. Burghley was not the man to neglect a useful instrument with such good will to serve him. But all that Mr. Spedding's industry and profound

interest in the subject has brought together throws but an uncertain light on Bacon's long disappointment. Was it the rooted misgiving of a man of affairs like Burghley at that passionate contempt of all existing knowledge, and that undoubting confidence in his own power to make men know, as they never had known, which Bacon was even now professing? Or was it something soft and over-obsequious in character which made the uncle, who knew well what men he wanted, disinclined to encourage and employ the nephew? Was Francis not hard enough, not narrow enough, too full of ideas, too much alive to the shakiness of current doctrines and arguments on religion and policy? Was he too open to new impressions, made by objections or rival views? Or did he show signs of wanting backbone to stand amid difficulties and threatening prospects? Did Burghley see something in him of the pliability which he could remember as the serviceable quality of his own young days — which suited those days of rapid change, but not days when change was supposed to be over, and when the qualities which were wanted were those which resist and defy it? The only thing that is clear is that Burghley, in spite of Bacon's continual applications, abstained to the last from advancing his fortunes.

Whether employed by government or not, Bacon began at this time to prepare those carefully-written papers on the public affairs of the day, of which he has left a good many. In our day they would have been pamphlets or magazine articles. In his they were circulated in manuscript, and only occasionally printed. The first of any importance is a letter of advice to the Queen, about the year 1585, on the policy to be followed with a view to keeping in check the Roman Catholic interest at home and abroad. It is calm, sagacious, and, according to the fashion of the age, slightly Machiavellian. But the first subject on which Bacon exhibited his characteristic qualities, his appreciation of facts, his balance of thought, and his power, when not personally committed, of standing aloof from the ordinary prejudices and assumptions of men round him, was the religious condition and prospects of the English Church. Bacon had been brought up in a Puritan household of the straitest sect. His mother was an earnest, severe, and intolerant Calvinist, deep in the interests and cause of her party, bitterly

resenting all attempts to keep in order its pretensions. She was a masterful woman, claiming to meddle with her brother-in-law's policy, and though a most affectionate mother she was a woman of violent and ungovernable temper. Her letters to her son Antony, whom she loved passionately, but whom she suspected of keeping dangerous and papistical company, show us the imperious spirit in which she claimed to interfere with her sons; and they show also that in Francis she did not find all the deference which she looked for. Recommending Antony to frequent "the religious exercises of the sincerer sort," she warns him not to follow his brother's advice or example. Antony was advised to use prayer twice a day with his servants. "Your brother," she adds, "is too negligent therein." She is anxious about Antony's health, and warns him not to fall into his brother's ill-ordered habits: "I verily think your brother's weak stomach to digest hath been much caused and confirmed by untimely going to bed, and then musing *nescio quid* when he should sleep, and then in consequent by late rising and long lying in bed, whereby his men are made slothful and himself continueth sickly. But my sons haste not to hearken to their mother's good counsel in time to prevent." It seems clear that Francis Bacon had shown his mother that not only in the care of his health, but in his judgment on religious matters, he meant to go his own way. Mr. Spedding thinks that she must have had much influence on him; it seems more likely that he resented her interference, and that the hard and narrow arrogance which she read into the Gospel produced in him a strong reaction. Bacon was obsequious to the tyranny of power, but he was never inclined to bow to the tyranny of opinion; and the tyranny of Puritan infallibility was the last thing to which he was likely to submit. His mother would have wished him to sit under Cartwright and Travers. The friend of his choice was the Anglican preacher, Dr. Andrewes, to whom he submitted all his works, and whom he called his "inquisitor general;" and he was proud to sign himself the pupil of Whitgift, and to write for him — the archbishop of whom Lady Bacon wrote to her son Antony, veiling the dangerous sentiment in Greek, "that he was the ruin of the Church, for he loved his own glory more than Christ's."

Certainly, in the remarkable paper on *Controversies in the Church* (1589), Bacon had ceased to feel or to speak as a Puritan. The paper is an attempt to compose the controversy by pointing out the mistakes in judgment, in temper, and in method on both sides. It is entirely unlike what a Puritan would have written: it is too moderate, too tolerant, too neutral, though like most essays of conciliation it is open to the rejoinder from both sides — certainly from the Puritan — that it begs the question by assuming the unimportance of the matters about which each contended with so much zeal. It is the confirmation, but also the complement, and in some ways the correction of Hooker's contemporary view of the quarrel which was threatening the life of the English Church, and not even Hooker could be so comprehensive and so fair. For Hooker had to defend much that was indefensible: he had to defend a great traditional system, just convulsed by a most tremendous shock — a shock and alteration, as Bacon says, "the greatest and most dangerous that can be in a State," in which old clews and habits and rules were confused and all but lost; in which a frightful amount of personal incapacity and worthlessness had, from sheer want of men, risen to the high places of the Church; and in which force and violence, sometimes of the most hateful kind, had come to be accepted as ordinary instruments in the government of souls. Hooker felt too strongly the unfairness, the folly, the intolerant aggressiveness, the malignity of his opponents — he was too much alive to the wrongs inflicted by them on his own side, and to the incredible absurdity of their arguments — to do justice to what was only too real in the charges and complaints of those opponents. But Bacon came from the very heart of the Puritan camp. He had seen the inside of Puritanism — its best as well as its worst side. He witnesses to the humility, the conscientiousness, the labour, the learning, the hatred of sin and wrong, of many of its preachers. He had heard, and heard with sympathy, all that could be urged against the bishops' administration, and against a system of legal oppression in the name of the Church. Where religious elements were so confusedly mixed, and where each side had apparently so much to urge on behalf of its claims, he saw the deep mistake of loftily ignoring facts, and of want of patience and forbearance with

those who were scandalised at abuses, while the abuses, in some cases monstrous, were tolerated and turned to profit. Towards the bishops and their policy, though his language is very respectful, for the government was implicated, he is very severe. They punish and restrain, but they do not themselves mend their ways or supply what was wanting; and theirs are "*injuriæ potentiorum*"— "injuries come from them that have the upperhand." But Hooker himself did not put his finger more truly and more surely on the real mischief of the Puritan movement: on the immense outbreak in it of unreasonable party spirit and visible personal ambition— "these are the true successors of Diotrephes and not my lord bishops" — on the gradual development of the Puritan theory till it came at last to claim a supremacy as unquestionable and intolerant as that of the Papacy; on the servile affectation of the fashions of Geneva and Strasburg; on the poverty and foolishness of much of the Puritan teaching — its inability to satisfy the great questions which it raised in the soul, its unworthy dealing with Scripture— "naked examples, conceited inferences, and forced allusions, which mine into all certainty of religion"— "the word, the bread of life, they toss up and down, they break it not;" on their undervaluing of moral worth, if it did not speak in their phraseology— "as they censure virtuous men by the names of *civil* and *moral*, so do they censure men truly and godly wise, who see into the vanity of their assertions, by the name of *politiques*, saying that their wisdom is but carnal and savouring of man's brain." Bacon saw that the Puritans were aiming at a tyranny which, if they established it, would be more comprehensive, more searching, and more cruel than that of the older systems; but he thought it a remote and improbable danger, and that they might safely be tolerated for the work they did in education and preaching, "because the work of exhortation doth chiefly rest upon these men, and they have a zeal and hate of sin." But he ends by warning them lest "that be true which one of their adversaries said, *that they have but two small wants — knowledge and love*." One complaint that he makes of them is a curious instance of the changes of feeling, or at least of language, on moral subjects. He accuses them of "having pronounced generally, and without difference, all untruths unlawful," forgetful of the Egyptian midwives, and

Rahab, and Solomon, and even of Him "who, the more to touch the hearts of the disciples with a holy dalliance, made as though he would have passed Emmaus." He is thinking of their failure to apply a principle which was characteristic of his mode of thought, that even a statement about a virtue like veracity "hath limit as all things else have;" but it is odd to find Bacon bringing against the Puritans the converse of the charge which his age, and Pascal afterwards, brought against the Jesuits. The essay, besides being a picture of the times as regards religion, is an example of what was to be Bacon's characteristic strength and weakness: his strength in lifting up a subject which had been degraded by mean and wrangling disputations, into a higher and larger light, and bringing to bear on it great principles and the results of the best human wisdom and experience, expressed in weighty and pregnant maxims; his weakness in forgetting, as, in spite of his philosophy, he so often did, that the grandest major premises need well-proved and ascertained minors, and that the enunciation of a principle is not the same thing as the application of it. Doubtless there is truth in his closing words; but each party would have made the comment that what he had to prove, and had not proved, was that by following his counsel they would "love the whole world better than a part."

"Let them not fear ... the fond calumny of *neutrality*; but let them know that is true which is said by a wise man, *that neuters in contentions are either better or worse than either side*. These things have I in all sincerity and simplicity set down touching the controversies which now trouble the Church of England; and that without all art and insinuation, and therefore not like to be grateful to either part. Notwithstanding, I trust what has been said shall find a correspondence in their minds which are not embarked in partiality, and which *love the whole letter than a part*"

Up to this time, though Bacon had showed himself capable of taking a broad and calm view of questions which it was the fashion among good men, and men who were in possession of the popular ear, to treat with narrowness and heat, there was nothing to disclose his deeper thoughts — nothing foreshadowed the purpose which was to fill his life. He had, indeed, at the age of twenty-five,

written a "youthful" philosophical essay, to which he gave the pompous title "*Temporis Partus Maximus*," "the Greatest Birth of Time." But he was thirty-one when we first find an indication of the great idea and the great projects which were to make his name famous. This indication is contained in an earnest appeal to Lord Burghley for some help which should not be illusory. Its words are distinct and far-reaching, and they are the first words from him which tell us what was in his heart. The letter has the interest to us of the first announcement of a promise which, to ordinary minds, must have appeared visionary and extravagant, but which was so splendidly fulfilled; the first distant sight of that sea of knowledge which henceforth was opened to mankind, but on which no man, as he thought, had yet entered. It contains the famous avowal— "*I have taken all knowledge to be my province*" — made in the confidence born of long and silent meditations and questionings, but made in a simple good faith which is as far as possible from vain boastfulness.

"MY LORD, — With as much confidence as mine own honest and faithful devotion unto your service and your honourable correspondence unto me and my poor estate can breed in a man, do I commend myself unto your Lordship. I wax now somewhat ancient: one and thirty years is a great deal of sand in the hour glass. My health, I thank God, I find confirmed; and I do not fear that action shall impair it, because I account my ordinary course of study and meditation to be more painful than most parts of action are. I ever bare a mind (in some middle place that I could discharge) to serve her Majesty, not as a man born under Sol, that loveth honour, nor under Jupiter, that loveth business (for the contemplative planet carrieth me away wholly), but as a man born under an excellent sovereign that deserveth the dedication of all men's abilities. Besides, I do not find in myself so much self-love, but that the greater parts of my thoughts are to deserve well (if I be able) of my friends, and namely of your Lordship; who, being the Atlas of this commonwealth, the honour of my house, and the second founder of my poor estate, I am tied by all duties, both of a good patriot, and of an unworthy kinsman, and of an obliged servant, to employ whatsoever I am to do you service. Again, the meanness of my estate doth somewhat move me; for

though I cannot accuse myself that I am either prodigal or slothful, yet my health is not to spend, nor my course to get. Lastly, I confess that I have as vast contemplative ends as I have moderate civil ends; for I have taken all knowledge to be my province; and if I could purge it of two sorts of rovers, whereof the one with frivolous disputations, confutations, and verbosities, the other with blind experiments and auricular traditions and impostures, hath committed so many spoils, I hope I should bring in industrious observations, grounded conclusions, and profitable inventions and discoveries: the best state of that province. This, whether it be curiosity or vain glory, or nature, or (if one take it favourably) *philanthropia*, is so fixed in my mind as it cannot be removed. And I do easily see, that place of any reasonable countenance doth bring commandment of more wits than of a man's own; which is the thing I greatly affect. And for your Lordship, perhaps you shall not find more strength and less encounter in any other. And if your Lordship shall find now, or at any time, that I do seek or affect any place whereunto any that is nearer unto your Lordship shall be concurrent, say then that I am a most dishonest man. And if your Lordship will not carry me on, I will not do as Anaxagoras did, who reduced himself with contemplation unto voluntary poverty, but this I will do — I will sell the inheritance I have, and purchase some lease of quick revenue, or some office of gain that shall be executed by deputy, and so give over all care of service, and become some sorry book-maker, or a true pioneer in that mine of truth which (he said) lay so deep. This which I have writ unto your Lordship is rather thoughts than words, being set down without all art, disguising, or reservation. Wherein I have done honour both to your Lordship's wisdom, in judging that that will be best believed of your Lordship which is truest, and to your Lordship's good nature, in retaining nothing from you. And even so I wish your Lordship all happiness, and to myself means and occasions to be added to my faithful desire to do you service. From my lodgings at Gray's Inn."

This letter to his unsympathetic and suspicious, but probably not unfriendly relative, is the key to Bacon's plan of life; which, with numberless changes of form, he followed to the end. That is, a profession, steadily, seriously, and

laboriously kept to, in order to provide the means of living; and beyond that, as the ultimate and real end of his life, the pursuit, in a way unattempted before, of all possible human knowledge, and of the methods to improve it and make it sure and fruitful. And so his life was carried out. On the one hand it was a continual and pertinacious seeking after government employment, which could give credit to his name and put money in his pocket — attempts by general behaviour, by professional services when the occasion offered, by putting his original and fertile pen at the service of the government, to win confidence, and to overcome the manifest indisposition of those in power to think that a man who cherished the chimera of universal knowledge could be a useful public servant. On the other hand, all the while, in the crises of his disappointment or triumph, the one great subject lay next his heart, filling him with fire and passion — how really to know, and to teach men to know indeed, and to use their knowledge so as to command nature; the great hope to be the reformer and restorer of knowledge in a more wonderful sense than the world had yet seen in the reformation of learning and religion, and in the spread of civilised order in the great states of the Renaissance time. To this he gave his best and deepest thoughts; for this he was for ever accumulating, and for ever rearranging and reshaping those masses of observation and inquiry and invention and mental criticism which were to come in as parts of the great design which he had seen in the visions of his imagination, and of which at last he was only able to leave noble fragments, incomplete after numberless recastings. This was not indeed the only, but it was the predominant and governing, interest of his life. Whether as solicitor for Court favour or public office; whether drudging at the work of the law or managing State prosecutions; whether writing an opportune pamphlet against Spain or Father Parsons, or inventing a “device” for his Inn or for Lord Essex to give amusement to Queen Elizabeth; whether fulfilling his duties as member of Parliament or rising step by step to the highest places in the Council Board and the State; whether in the pride of success or under the amazement of unexpected and irreparable overthrow, while it seemed as if he was only measuring his strength against the rival ambitions of the day, in the same spirit

and with the same object as his competitors, the true motive of all his eagerness and all his labours was not theirs. He wanted to be powerful, and still more to be rich; but he wanted to be so, because without power and without money he could not follow what was to him the only thing worth following on earth — a real knowledge of the amazing and hitherto almost unknown world in which he had to live. Bacon, to us, at least, at this distance, who can only judge him from partial and imperfect knowledge, often seems to fall far short of what a man should be. He was not one of the high-minded and proud searchers after knowledge and truth, like Descartes, who were content to accept a frugal independence so that their time and their thoughts might be their own. Bacon was a man of the world, and wished to live in and with the world. He threatened sometimes retirement, but never with any very serious intention. In the Court was his element, and there were his hopes. Often there seems little to distinguish him from the ordinary place-hunters, obsequious and selfish, of every age; little to distinguish him from the servile and insincere flatterers, of whom he himself complains, who crowded the antechambers of the great Queen, content to submit with smiling face and thankful words to the insolence of her waywardness and temper, in the hope, more often disappointed than not, of hitting her taste on some lucky occasion, and being rewarded for the accident by a place of gain or honour. Bacon's history, as read in his letters, is not an agreeable one; after every allowance made for the fashions of language and the necessities of a suitor, there is too much of insincere profession of disinterestedness, too much of exaggerated profession of admiration and devoted service, too much of disparagement and insinuation against others, for a man who respected himself. He submitted too much to the miserable conditions of rising which he found. But, nevertheless, it must be said that it was for no mean object, for no mere private selfishness or vanity, that he endured all this. He strove hard to be a great man and a rich man. But it was that he might have his hands free and strong and well furnished to carry forward the double task of overthrowing ignorance and building up the new and solid knowledge on which his heart was set — that

immense conquest of nature on behalf of man which he believed to be possible, and of which he believed himself to have the key.

The letter to Lord Burghley did not help him much. He received the reversion of a place, the Clerkship of the Council, which did not become vacant for twenty years. But these years of service declined and place withheld were busy and useful ones. What he was most intent upon, and what occupied his deepest and most serious thought, was unknown to the world round him, and probably not very intelligible to his few intimate friends, such as his brother Antony and Dr. Andrewes. Meanwhile he placed his pen at the disposal of the authorities, and though they regarded him more as a man of study than of practice and experience, they were glad to make use of it. His versatile genius found another employment. Besides his affluence in topics, he had the liveliest fancy and most active imagination. But that he wanted the sense of poetic fitness and melody, he might almost be supposed, with his reach and play of thought, to have been capable, as is maintained in some eccentric modern theories, of writing Shakespeare's plays. No man ever had a more imaginative power of illustration drawn from the most remote and most unlikely analogies; analogies often of the quaintest and most unexpected kind, but often also not only felicitous in application but profound and true. His powers were early called upon for some of those sportive compositions in which that age delighted on occasions of rejoicing or festival. Three of his contributions to these "devices" have been preserved — two of them composed in honour of the Queen, as "triumphs," offered by Lord Essex, one probably in 1592 and another in 1595; a third for a Gray's Inn revel in 1594. The "devices" themselves were of the common type of the time, extravagant, odd, full of awkward allegory and absurd flattery, and running to a prolixity which must make modern lovers of amusement wonder at the patience of those days; but the "discourses" furnished by Bacon are full of fine observation and brilliant thought and wit and happy illustration, which, fantastic as the general conception is, raises them far above the level of such fugitive trifles.

Among the fragmentary papers belonging to this time which have come down, not the least curious are those which throw light on his manner of working. While he was following out the great ideas which were to be the basis of his philosophy, he was as busy and as painstaking in fashioning the instruments by which they were to be expressed; and in these papers we have the records and specimens of this preparation. He was a great collector of sentences, proverbs, quotations, sayings, illustrations, anecdotes, and he seems to have read sometimes simply to gather phrases and apt words. He jots down at random any good and pointed remark which comes into his thought or his memory; at another time he groups a set of stock quotations with a special drift, bearing on some subject, such as the faults of universities or the habits of lawyers. Nothing is too minute for his notice. He brings together in great profusion mere forms, varied turns of expression, heads and tails of clauses and paragraphs, transitions, connections; he notes down fashions of compliment, of excuse or repartee, even morning and evening salutations; he records neat and convenient opening and concluding sentences, ways of speaking more adapted than others to give a special colour or direction to what the speaker or writer has to say — all that hook-and-eye work which seems so trivial and passes so unnoticed as a matter of course, and which yet is often hard to reach, and which makes all the difference between tameness and liveliness, between clearness and obscurity — all the difference, not merely to the ease and naturalness, but often to the logical force of speech. These collections it was his way to sift and transcribe again and again, adding as well as omitting. From one of these, belonging to 1594 and the following years, the *Promus of Formularies and Elegancies*, Mr. Spedding has given curious extracts; and the whole collection has been recently edited by Mrs. Henry Pott. Thus it was that he prepared himself for what, as we read it, or as his audience heard it, seems the suggestion or recollection of the moment. Bacon was always much more careful of the value or aptness of a thought than of its appearing new and original. Of all great writers he least minds repeating himself, perhaps in the very same words; so that a simile, an illustration, a quotation pleases him, he returns to it — he is never tired of it; it obviously gives him

satisfaction to introduce it again and again. These collections of odds and ends illustrate another point in his literary habits. His was a mind keenly sensitive to all analogies and affinities, impatient of a strict and rigid logical groove, but spreading as it were tentacles on all sides in quest of chance prey, and quickened into a whole system of imagination by the electric quiver imparted by a single word, at once the key and symbol of the thinking it had led to. And so he puts down word or phrase, so enigmatical to us who see it by itself, which to him would wake up a whole train of ideas, as he remembered the occasion of it — how at a certain time and place this word set the whole moving, seemed to breathe new life and shed new light, and has remained the token, meaningless in itself, which reminds him of so much.

When we come to read his letters, his speeches, his works, we come continually on the results and proofs of this early labour. Some of the most memorable and familiar passages of his writings are to be traced from the storehouses which he filled in these years of preparation. An example of this correspondence between the note-book and the composition is to be seen in a paper belonging to this period, written apparently to form part of a masque, or as he himself calls it, a "Conference of Pleasure," and entitled the *Praise of Knowledge*. It is interesting because it is the first draught which we have from him of some of the leading ideas and most characteristic language about the defects and the improvement of knowledge, which were afterwards embodied in the *Advancement* and the *Novum Organum*. The whole spirit and aim of his great reform is summed up in the following fine passage: "Facility to believe, impatience to doubt, temerity to assever, glory to know, doubt to contradict, end to gain, sloth to search, seeking things in words, resting in a part of nature — these and the like have been the things which have forbidden the happy match between the mind of man and the nature of things, and in place thereof have married it to vain notions and blind experiments.... Therefore, no doubt, the *sovereignty of man* lieth hid in knowledge; wherein many things are reserved which kings with their treasures cannot buy nor with their force command; their spials and intelligencers can give no news of them; their seamen and discoverers

cannot sail where they grow. Now we govern nature in opinions, but we are thrall unto her in necessity; but if we could be led by her in invention, we should command her in action."

To the same occasion as the discourse on the *Praise of Knowledge* belongs, also, one in *Praise of the Queen*. As one is an early specimen of his manner of writing on philosophy, so this is a specimen of what was equally characteristic of him — his political and historical writing. It is, in form, necessarily a panegyric, as high-flown and adulatory as such performances in those days were bound to be. But it is not only flattery. It fixes with true discrimination on the points in Elizabeth's character and reign which were really subjects of admiration and homage. Thus of her unquailing spirit at the time of the Spanish invasion — "Lastly, see a Queen, that when her realm was to have been invaded by an army, the preparation whereof was like the travail of an elephant, the provisions infinite, the setting forth whereof was the terror and wonder of Europe; it was not seen that her cheer, her fashion, her ordinary manner was anything altered; not a cloud of that storm did appear in that countenance wherein peace doth ever shine; but with excellent assurance and advised security she inspired her council, animated her nobility, redoubled the courage of her people; still having this noble apprehension, not only that she would communicate her fortune with them, but that it was she that would protect them, and not they her; which she testified by no less demonstration than her presence in camp. Therefore that magnanimity that neither feareth greatness of alteration, nor the vows of conspirators, nor the power of the enemy, is more than heroical."

These papers, though he put his best workmanship into them, as he invariably did with whatever he touched, were of an ornamental kind. But he did more serious work. In the year 1592 a pamphlet had been published on the Continent in Latin and English, *Responsio ad Edictum Reginæ Angliæ*, with reference to the severe legislation which followed on the Armada, making such charges against the Queen and the Government as it was natural for the Roman Catholic party to make, and making them with the utmost virulence and unscrupulousness. It was supposed to be written by the ablest of the Roman

pamphleteers, Father Parsons. The Government felt it to be a dangerous indictment, and Bacon was chosen to write the answer to it. He had additional interest in the matter, for the pamphlet made a special and bitter attack on Burghley, as the person mainly responsible for the Queen's policy. Bacon's reply is long and elaborate, taking up every charge, and reviewing from his own point of view the whole course of the struggle between the Queen and the supporters of the Roman Catholic interest abroad and at home. It cannot be considered an impartial review; besides that it was written to order, no man in England could then write impartially in that quarrel; but it is not more one-sided and uncandid than the pamphlet which it answers, and Bacon is able to recriminate with effect, and to show gross credulity and looseness of assertion on the part of the Roman Catholic advocate. But religion had too much to do with the politics of both sides for either to be able to come into the dispute with clean hands: the Roman Catholics meant much more than toleration, and the sanguinary punishments of the English law against priests and Jesuits were edged by something even keener than the fear of treason. But the paper contains some large surveys of public affairs, which probably no one at that time could write but Bacon. Bacon never liked to waste anything good which he had written; and much of what he had written in the panegyric in *Praise of the Queen* is made use of again, and transferred with little change to the pages of the *Observations on a Libel*.

CHAPTER II.

BACON AND ELIZABETH.

The last decade of the century, and almost of Elizabeth's reign (1590-1600), was an eventful one to Bacon's fortunes. In it the vision of his great design disclosed itself more and more to his imagination and hopes, and with more and more irresistible fascination. In it he made his first literary venture, the first edition of his *Essays* (1597), ten in number, the first-fruits of his early and ever watchful observation of men and affairs. These years, too, saw his first steps in public life, the first efforts to bring him into importance, the first great trials and tests of his character. They saw the beginning and they saw the end of his relations with the only friend who, at that time, recognised his genius and his purposes, certainly the only friend who ever pushed his claims; they saw the growth of a friendship which was to have so tragical a close, and they saw the beginnings and causes of a bitter personal rivalry which was to last through life, and which was to be a potent element hereafter in Bacon's ruin. The friend was the Earl of Essex. The competitor was the ablest, and also the most truculent and unscrupulous of English lawyers, Edward Coke.

While Bacon, in the shade, had been laying the foundations of his philosophy of nature, and vainly suing for legal or political employment, another man had been steadily rising in the Queen's favour and carrying all before him at Court — Robert Devereux, Lord Essex; and with Essex Bacon had formed an acquaintance which had ripened into an intimate and affectionate friendship. We commonly think of Essex as a vain and insolent favourite, who did ill the greatest work given him to do — the reduction of Ireland; who did it ill from some unexplained reason of spite and mischief; and who, when called to account for it, broke out into senseless and idle rebellion. This was the end. But he was not always thus. He began life with great gifts and noble ends; he was a serious, modest, and large-minded student both of books and things, and he turned his

studies to full account. He had imagination and love of enterprise, which gave him an insight into Bacon's ideas such as none of Bacon's contemporaries had. He was a man of simple and earnest religion; he sympathized most with the Puritans, because they were serious and because they were hardly used. Those who most condemn him acknowledge his nobleness and generosity of nature. Bacon in after days, when all was over between them, spoke of him as a man always *patientissimus veri*; "the more plainly and frankly you shall deal with my lord," he writes elsewhere, "not only in disclosing particulars, but in giving him *caveats* and admonishing him of any error which in this action he may commit (such is his lordship's nature), the better he will take it." "He must have seemed," says Mr. Spedding, a little too grandly, "in the eyes of Bacon like the hope of the world." The two men, certainly, became warmly attached. Their friendship came to be one of the closest kind, full of mutual services, and of genuine affection on both sides. It was not the relation of a great patron and useful dependant; it was, what might be expected in the two men, that of affectionate equality. Each man was equally capable of seeing what the other was, and saw it. What Essex's feelings were towards Bacon the results showed. Bacon, in after years, repeatedly claimed to have devoted his whole time and labour to Essex's service. Holding him, he says, to be "the fittest instrument to do good to the State, I applied myself to him in a manner which I think rarely happeneth among men; neglecting the Queen's service, mine own fortune, and, in a sort, my vocation, I did nothing but advise and ruminate with myself ... anything that might concern his lordship's honour, fortune, or service." The claim is far too wide. The "Queen's service" had hardly as yet come much in Bacon's way, and he never neglected it when it did come, nor his own fortune or vocation; his letters remain to attest his care in these respects. But no doubt Bacon was then as ready to be of use to Essex, the one man who seemed to understand and value him, as Essex was desirous to be of use to Bacon.

And it seemed as if Essex would have the ability as well as the wish. Essex was, without exception, the most brilliant man who ever appeared at Elizabeth's Court, and it seemed as if he were going to be the most powerful. Leicester was

dead. Burghley was growing old, and indisposed for the adventures and levity which, with all her grand power of ruling, Elizabeth loved. She needed a favourite, and Essex was unfortunately marked out for what she wanted. He had Leicester's fascination, without his mean and cruel selfishness. He was as generous, as gallant, as quick to descry all great things in art and life, as Philip Sidney, with more vigour and fitness for active life than Sidney. He had not Raleigh's sad, dark depths of thought, but he had a daring courage equal to Raleigh's, without Raleigh's cynical contempt for mercy and honour. He had every personal advantage requisite for a time when intellect, and ready wit, and high-tempered valour, and personal beauty, and skill in affairs, with equal skill in amusements, were expected to go together in the accomplished courtier. And Essex was a man not merely to be courted and admired, to shine and dazzle, but to be loved. Elizabeth, with her strange and perverse emotional constitution, loved him, if she ever loved any one. Every one who served him loved him; and he was, as much as any one could be in those days, a popular favourite. Under better fortune he might have risen to a great height of character; in Elizabeth's Court he was fated to be ruined.

For in that Court all the qualities in him which needed control received daily stimulus, and his ardour and high-aiming temper turned into impatience and restless irritability. He had a mistress who was at one time in the humour to be treated as a tender woman, at another as an outrageous flirt, at another as the haughtiest and most imperious of queens; her mood varied, no one could tell how, and it was most dangerous to mistake it. It was part of her pleasure to find in her favourite a spirit as high, a humour as contradictory and determined, as her own; it was the charming contrast to the obsequiousness or the prudence of the rest; but no one could be sure at what unlooked-for moment, and how fiercely, she might resent in earnest a display of what she had herself encouraged. Essex was ruined for all real greatness by having to suit himself to this bewildering and most unwholesome and degrading waywardness. She taught him to think himself irresistible in opinion and in claims; she amused herself in teaching him how completely he was mistaken. Alternately spoiled and crossed,

he learned to be exacting, unreasonable, absurd in his pettish resentments or brooding sullenness. He learned to think that she must be dealt with by the same methods which she herself employed. The effect was not produced in a moment; it was the result of a courtiership of sixteen years. But it ended in corrupting a noble nature. Essex came to believe that she who cowed others must be frightened herself; that the stinging injustice which led a proud man to expect, only to see how he would behave when refused, deserved to be brought to reason by a counter-buffet as rough as her own insolent caprice. He drifted into discontent, into disaffection, into neglect of duty, into questionable schemings for the future of a reign that must shortly end, into criminal methods of guarding himself, of humbling his rivals and regaining influence. A "fatal impatience," as Bacon calls it, gave his rivals an advantage which, perhaps in self-defence, they could not fail to take; and that career, so brilliant, so full of promise of good, ended in misery, in dishonour, in remorse, on the scaffold of the Tower.

With this attractive and powerful person Bacon's fortunes, in the last years of the century, became more and more knit up. Bacon was now past thirty, Essex a few years younger. In spite of Bacon's apparent advantage and interest at Court, in spite of abilities, which, though his genius was not yet known, his contemporaries clearly recognised, he was still a struggling and unsuccessful man: ambitious to rise, for no unworthy reasons, but needy, in weak health, with careless and expensive habits, and embarrassed with debt. He had hoped to rise by the favour of the Queen and for the sake of his father. For some ill-explained reason he was to the last disappointed. Though she used him "for matters of state and revenue," she either did not like him, or did not see in him the servant she wanted to advance. He went on to the last pressing his uncle, Lord Burghley. He applied in the humblest terms, he made himself useful with his pen, he got his mother to write for him; but Lord Burghley, probably because he thought his nephew more of a man of letters than a sound lawyer and practical public servant, did not care to bring him forward. From his cousin, Robert Cecil, Bacon received polite words and friendly assurances. Cecil may have undervalued him, or have been jealous of him, or suspected him as a friend of Essex; he certainly

gave Bacon good reason to think that his words meant nothing. Except Essex, and perhaps his brother Antony — the most affectionate and devoted of brothers — no one had yet recognised all that Bacon was. Meanwhile time was passing. The vastness, the difficulties, the attractions of that conquest of all knowledge which he dreamed of, were becoming greater every day to his thoughts. The law, without which he could not live, took up time and brought in little. Attendance on the Court was expensive, yet indispensable, if he wished for place. His mother was never very friendly, and thought him absurd and extravagant. Debts increased and creditors grumbled. The outlook was discouraging, when his friendship with Essex opened to him a more hopeful prospect.

In the year 1593 the Attorney-General's place was vacant, and Essex, who in that year became a Privy Councillor, determined that Bacon should be Attorney-General. Bacon's reputation as a lawyer was overshadowed by his philosophical and literary pursuits. He was thought young for the office, and he had not yet served in any subordinate place. And there was another man, who was supposed to carry all English law in his head, full of rude force and endless precedents, hard of heart and voluble of tongue, who also wanted it. An Attorney-General was one who would bring all the resources and hidden subtleties of English law to the service of the Crown, and use them with thorough-going and unflinching resolution against those whom the Crown accused of treason, sedition, or invasion of the prerogative. It is no wonder that the Cecils, and the Queen herself, thought Coke likely to be a more useful public servant than Bacon: it is certain what Coke himself thought about it, and what his estimate was of the man whom Essex was pushing against him. But Essex did not take up his friend's cause in the lukewarm fashion in which Burghley had patronised his nephew. There was nothing that Essex pursued with greater pertinacity. He importuned the Queen. He risked without scruple offending her. She apparently long shrank from directly refusing his request. The Cecils were for Coke — the "*Huddler*" as Bacon calls him, in a letter to Essex; but the appointment was delayed. All through 1593, and until April, 1594, the struggle went on.

When Robert Cecil suggested that Essex should be content with the Solicitor's place for Bacon, "praying him to be well advised, for if his Lordship had spoken of that it might have been of easier digestion to the Queen," he turned round on Cecil —

"Digest me no digesting," said the Earl; "for the Attorneyship is that I must have for Francis Bacon; and in that I will spend my uttermost credit, friendship, and authority against whomsoever, and that whosoever went about to procure it to others, that it should cost both the mediators and the suitors the setting on before they came by it. And this be you assured of, Sir Robert," quoth the Earl, "for now do I fully declare myself; and for your own part, Sir Robert, I do think much and strange both of my Lord your father and you, that can have the mind to seek the preferment of a stranger before so near a kinsman; namely, considering if you weigh in a balance his parts and sufficiency in any respect with those of his competitor, excepting only four poor years of admittance, which Francis Bacon hath more than recompensed with the priority of his reading; in all other respects you shall find no comparison between them."

But the Queen's disgust at some very slight show of independence on Bacon's part in Parliament, unforgiven in spite of repeated apologies, together with the influence of the Cecils and the pressure of so formidable and so useful a man as Coke, turned the scale against Essex. In April, 1594, Coke was made Attorney. Coke did not forget the pretender to law, as he would think him, who had dared so long to dispute his claims; and Bacon was deeply wounded. "No man," he thought, "had ever received a more exquisite disgrace," and he spoke of retiring to Cambridge "to spend the rest of his life in his studies and contemplations." But Essex was not discouraged. He next pressed eagerly for the Solicitorship. Again, after much waiting, he was foiled. An inferior man was put over Bacon's head. Bacon found that Essex, who could do most things, for some reason could not do this. He himself, too, had pressed his suit with the greatest importunity on the Queen, on Burghley, on Cecil, on every one who could help him; he reminded the Queen how many years ago it was since he first kissed her hand in her service, and ever since had used his wits to please; but it was all in

vain. For once he lost patience. He was angry with Essex; the Queen's anger with Essex had, he thought, recoiled on his friend. He was angry with the Queen; she held his long waiting cheap; she played with him and amused herself with delay; he would go abroad, and he "knew her Majesty's nature, that she neither careth though the whole surname of the Bacons travelled, nor of the Cecils neither." He was very angry with Robert Cecil; affecting not to believe them, he tells him stories he has heard of his corrupt and underhand dealing. He writes almost a farewell letter of ceremonious but ambiguous thanks to Lord Burghley, hoping that he would impute any offence that Bacon might have given to the "complexion of a suitor, and a tired sea-sick suitor," and speaking despairingly of his future success in the law. The humiliations of what a suitor has to go through torment him: "It is my luck," he writes to Cecil, "still to be akin to such things as I neither like in nature nor would willingly meet with in my course, but yet cannot avoid without show of base timorousness or else of unkind or suspicious strangeness." And to his friend Fulke Greville he thus unburdens himself:

"SIR, — I understand of your pains to have visited me, for which I thank you. My matter is an endless question. I assure you I had said *Requiesce anima mea*; but I now am otherwise put to my psalter; *Nolite confidere*. I dare go no further. Her Majesty had by set speech more than once assured me of her intention to call me to her service, which I could not understand but of the place I had been named to. And now whether *invidus homo hoc fecit*; or whether my matter must be an appendix to my Lord of Essex suit; or whether her Majesty, pretending to prove my ability, meaneth but to take advantage of some errors which, like enough, at one time or other I may commit; or what is it? but her Majesty is not ready to despatch it. And what though the Master of the Rolls, and my Lord of Essex, and yourself, and others, think my case without doubt, yet in the meantime I have a hard condition, to stand so that whatsoever service I do to her Majesty it shall be thought to be but *servitium viscatum*, lime-twigs and fetches to place myself; and so I shall have envy, not thanks. This is a course to quench all good spirits, and to corrupt every man's nature, which will, I fear, much hurt

her Majesty's service in the end. I have been like a piece of stuff bespoken in the shop; and if her Majesty will not take me, it may be the selling by parcels will be more gainful. For to be, as I told you, like a child following a bird, which when he is nearest flieth away and lighteth a little before, and then the child after it again, and so *in infinitum*, I am weary of it; as also of wearying my good friends, of whom, nevertheless, I hope in one course or other gratefully to deserve. And so, not forgetting your business, I leave to trouble you with this idle letter; being but *justa et moderata querimonia*; for indeed I do confess, *primus amor* will not easily be cast off. And thus again I commend me to you."

After one more effort the chase was given up, at least for the moment; for it was soon resumed. But just now Bacon felt that all the world was against him. He would retire "out of the sunshine into the shade." One friend only encouraged him. He did more. He helped him when Bacon most wanted help, in his straitened and embarrassed "estate." Essex, when he could do nothing more, gave Bacon an estate worth at least £1800. Bacon's resolution is recorded in the following letter:

"IT MAY PLEASE YOUR GOOD LORDSHIP, — I pray God her Majesty's weighing be not like the weight of a balance, *gravia deorsum levia sursum*. But I am as far from being altered in devotion towards her, as I am from distrust that she will be altered in opinion towards me, when she knoweth me better. For myself, I have lost some opinion, some time, and some means; this is my account; but then for opinion, it is a blast that goeth and cometh; for time, it is true it goeth and cometh not; but yet I have learned that it may be redeemed. For means, I value that most; and the rather, *because I am purposed not to follow the practice of the law* (*if her Majesty command me in any particular, I shall be ready to do her willing service*); and my reason is only, *because it drinketh too much time, which I have dedicated to better purposes*. But even for that point of estate and means, I partly lean to Thales' opinion, That a philosopher may be rich if he will. Thus your Lordship seeth how I comfort myself; to the increase whereof I would fain please myself to believe that to be true which my Lord Treasurer writeth; which is, that it is more than a philosopher morally can

disgest. But without any such high conceit, I esteem it like the pulling out of an aching tooth, which, I remember, when I was a child, and had little philosophy, I was glad of when it was done. For your Lordship, I do think myself more beholding to you than to any man. And I say, I reckon myself as a *common* (not popular but *common*); and as much as is lawful to be enclosed of a common, so much your Lordship shall be sure to have. — Your Lordship's to obey your honourable commands, more settled than ever."

It may be that, as Bacon afterwards maintained, the closing sentences of this letter implied a significant reserve of his devotion. But during the brilliant and stormy years of Essex's career which followed, Bacon's relations to him continued unaltered. Essex pressed Bacon's claims whenever a chance offered. He did his best to get Bacon a rich wife — the young widow of Sir Christopher Hatton — but in vain. Instead of Bacon she accepted Coke, and became famous afterwards in the great family quarrel, in which Coke and Bacon again found themselves face to face, and which nearly ruined Bacon before the time. Bacon worked for Essex when he was wanted, and gave the advice which a shrewd and cautious friend would give to a man who, by his success and increasing pride and self-confidence, was running into serious dangers, arming against himself deadly foes, and exposing himself to the chances of fortune. Bacon was nervous about Essex's capacity for war, a capacity which perhaps was not proved, even by the most brilliant exploit of the time, the capture of Cadiz, in which Essex foreshadowed the heroic but well-calculated audacities of Nelson and Cochrane, and showed himself as little able as they to bear the intoxication of success, and to work in concert with envious and unfriendly associates. At the end of the year 1596, the year in which Essex had won such reputation at Cadiz, Bacon wrote him a letter of advice and remonstrance. It is a lively picture of the defects and dangers of Essex's behaviour as the Queen's favourite; and it is a most characteristic and worldly-wise summary of the ways which Bacon would have him take, to cure the one and escape the other. Bacon had, as he says, "good reason to think that the Earl's fortune comprehended his own." And the letter may perhaps be taken as an indirect warning to Essex that Bacon must, at any

rate, take care of his own fortune, if the Earl persisted in dangerous courses. Bacon shows how he is to remove the impressions, strong in the Queen's mind, of Essex's defects; how he is, by due submissions and stratagems, to catch her humour —

"But whether I counsel you the best, or for the best, duty bindeth me to offer to you my wishes. I said to your Lordship last time, *Martha, Martha, attendis ad plurima, unum sufficit*; win the Queen: if this be not the beginning, of any other course I see no end."

Bacon gives a series of minute directions how Essex is to disarm the Queen's suspicions, and to neutralize the advantage which his rivals take of them; how he is to remove "the opinion of his nature being *opiniastre* and not rulable;" how, avoiding the faults of Leicester and Hatton, he is, as far as he can, to "allege them for authors and patterns." Especially, he must give up that show of soldier-like distinction, which the Queen so disliked, and take some quiet post at Court. He must not alarm the Queen by seeking popularity; he must take care of his estate; he must get rid of some of his officers; and he must not be disquieted by other favourites.

Bacon wished, as he said afterwards, to see him "with a white staff in his hand, as my Lord of Leicester had," an honour and ornament to the Court in the eyes of the people and foreign ambassadors. But Essex was not fit for the part which Bacon urged upon him, that of an obsequious and vigilant observer of the Queen's moods and humours. As time went on, things became more and more difficult between him and his strange mistress; and there were never wanting men who, like Cecil and Raleigh, for good and bad reasons, feared and hated Essex, and who had the craft and the skill to make the most of his inexcusable errors. At last he allowed himself, from ambition, from the spirit of contradiction, from the blind passion for doing what he thought would show defiance to his enemies, to be tempted into the Irish campaign of 1599. Bacon at a later time claimed credit for having foreseen and foretold its issue. "I did as plainly see his overthrow, chained as it were by destiny to that journey, as it is possible for any man to ground a judgment on future contingents." He warned

Essex, so he thought in after years, of the difficulty of the work; he warned him that he would leave the Queen in the hands of his enemies: “It would be ill for her, ill for him, ill for the State.” “I am sure,” he adds, “I never in anything in my life dealt with him in like earnestness by speech, by writing, and by all the means I could devise.” But Bacon’s memory was mistaken. We have his letters. When Essex went to Ireland, Bacon wrote only in the language of sanguine hope — so little did he see “overthrow chained by destiny to that journey,” that “some good spirit led his pen to presage to his Lordship success;” he saw in the enterprise a great occasion of honour to his friend; he gave prudent counsels, but he looked forward confidently to Essex being as “fatal a captain to that war, as Africanus was to the war of Carthage.” Indeed, however anxious he may have been, he could not have foreseen Essex’s unaccountable and to this day unintelligible failure. But failure was the end, from whatever cause; failure, disgraceful and complete. Then followed wild and guilty but abortive projects for retrieving his failure, by using his power in Ireland to make himself formidable to his enemies at Court, and even to the Queen herself. He intrigued with Tyrone; he intrigued with James of Scotland; he plunged into a whirl of angry and baseless projects, which came to nothing the moment they were discussed. How empty and idle they were was shown by his return against orders to tell his own story at Nonsuch, and by thus placing himself alone and undeniably in the wrong, in the power of the hostile Council. Of course it was not to be thought of that Cecil should not use his advantage in the game. It was too early, irritated though the Queen was, to strike the final blow. But it is impossible not to see, looking back over the miserable history, that Essex was treated in a way which was certain, sooner or later, to make him, being what he was, plunge into a fatal and irretrievable mistake. He was treated as a cat treats a mouse; he was worried, confined, disgraced, publicly reprimanded, brought just within verge of the charge of treason, but not quite, just enough to discredit and alarm him, but to leave him still a certain amount of play. He was made to see that the Queen’s favour was not quite hopeless; but that nothing but the most absolute and unreserved humiliation could recover it. It was plain to any one

who knew Essex that this treatment would drive Essex to madness. “These same gradations of yours” — so Bacon represents himself expostulating with the Queen on her caprices— “are fitter to corrupt than to correct any mind of greatness.” They made Essex desperate; he became frightened for his life, and he had reason to be so, though not in the way which he feared. At length came the stupid and ridiculous outbreak of the 8th of February, 1600/1601, a plot to seize the palace and raise the city against the ministers, by the help of a few gentlemen armed only with their rapiers. As Bacon himself told the Queen, “if some base and cruel-minded persons had entered into such an action, it might have caused much blow and combustion; but it appeared well that they were such as knew not how to play the malefactors!” But it was sufficient to bring Essex within the doom of treason.

Essex knew well what the stake was. He lost it, and deserved to lose it, little as his enemies deserved to win it; for they, too, were doing what would have cost them their heads if Elizabeth had known it — corresponding, as Essex was accused of doing, with Scotland about the succession, and possibly with Spain. But they were playing cautiously and craftily; he with bungling passion. He had been so long accustomed to power and place, that he could not endure that rivals should keep him out of it. They were content to have their own way, while affecting to be the humblest of servants; he would be nothing less than a Mayor of the Palace. He was guilty of a great public crime, as every man is who appeals to arms for anything short of the most sacred cause. He was bringing into England, which had settled down into peaceable ways, an imitation of the violent methods of France and the Guises. But the crime as well as the penalty belonged to the age, and crimes legally said to be against the State mean morally very different things, according to the state of society and opinion. It is an unfairness verging on the ridiculous, when the ground is elaborately laid for keeping up the impression that Essex was preparing a real treason against the Queen like that of Norfolk. It was a treason of the same sort and order as that for which Northumberland sent Somerset to the block: the treason of being an unsuccessful rival.

Meanwhile Bacon had been getting gradually into the unofficial employ of the Government. He had become one of the "Learned Counsel" — lawyers with subordinate and intermittent work, used when wanted, but without patent or salary, and not ranking with the regular law officers. The Government had found him useful in affairs of the revenue, in framing interrogatories for prisoners in the Tower, in drawing up reports of plots against the Queen. He did not in this way earn enough to support himself; but he had thus come to have some degree of access to the Queen, which he represents as being familiar and confidential, though he still perceived, as he says himself, that she did not like him. At the first news of Essex's return to England, Bacon greeted him —

"MY LORD, — Conceiving that your Lordship came now up in the person of a good servant to see your sovereign mistress, which kind of compliments are many times *instar magnorum meritorum*, and therefore it would be hard for me to find you, I have committed to this poor paper the humble salutations of him *that is more yours than any man's, and more yours than any man*. To these salutations I add a due and joyful gratulation, confessing that your Lordship, in your last conference with me before your journey, spake not in vain, God making it good, That you trusted we should say *Quis putasset*! Which as it is found true in a happy sense, so I wish you do not find another *Quis putasset* in the manner of taking this so great a service. But I hope it is, as he said, *Nubecula est, cito transibit*, and that your Lordship's wisdom and obsequious circumspection and patience will turn all to the best. So referring all to some time that I may attend you, I commit you to God's best preservation."

But when Essex's conduct in Ireland had to be dealt with, Bacon's services were called for; and from this time his relations towards Essex were altered. Every one, no one better than the Queen herself, knew all that he owed to Essex. It is strangely illustrative of the time, that especially as Bacon held so subordinate a position, he should have been required, and should have been trusted, to act against his only and most generous benefactor. It is strange, too, that however great his loyalty to the Queen, however much and sincerely he might condemn his friend's conduct, he should think it possible to accept the

task. He says that he made some remonstrance; and he says, no doubt truly, that during the first stage of the business he used the ambiguous position in which he was placed to soften Essex's inevitable punishment, and to bring about a reconciliation between him and the Queen. But he was required, as the Queen's lawyer, to set forth in public Essex's offences; and he admits that he did so "not over tenderly." Yet all this, even if we have misgivings about it, is intelligible. If he had declined, he could not, perhaps, have done the service which he assures us that he tried to do for Essex; and it is certain that he would have had to reckon with the terrible lady who in her old age still ruled England from the throne of Henry VIII., and who had certainly no great love for Bacon himself. She had already shown him in a much smaller matter what was the forfeit to be paid for any resistance to her will. All the hopes of his life must perish; all the grudging and suspicious favours which he had won with such unremitting toil and patient waiting would be sacrificed, and he would henceforth live under the wrath of those who never forgave. And whatever he did for himself, he believed that he was serving Essex. His scheming imagination and his indefatigable pen were at work. He tried strange indirect methods; he invented a correspondence between his brother and Essex, which was to fall into the Queen's hands in order to soften her wrath and show her Essex's most secret feelings. When the Queen proposed to dine with him at his lodge in Twickenham Park, "though I profess not to be a poet," he "prepared a sonnet tending and alluding to draw on her Majesty's reconcilement to my Lord." It was an awkward thing for one who had been so intimate with Essex to be so deep in the counsels of those who hated him. He complains that many people thought him ungrateful and disloyal to his friend, and that stories circulated to his disadvantage, as if he were poisoning the Queen's ear against Essex. But he might argue fairly enough that, wilful and wrong-headed as Essex had been, it was the best that he could now do for him; and as long as it was only a question of Essex's disgrace and enforced absence from Court, Bacon could not be bound to give up the prospects of his life — indeed, his public duty as a subordinate servant of government — on account of his friend's inexcusable and dangerous follies. Essex did not see it so, and in the

subjoined correspondence had the advantage; but Bacon's position, though a higher one might be imagined, where men had been such friends as these two men had been, is quite a defensible one:

"MY LORD, — No man can better expound my doings than your Lordship, which maketh me need to say the less. Only I humbly pray you to believe that I aspire to the conscience and commendation first of *bonus civis*, which with us is a good and true servant to the Queen, and next of *bonus vir*, that is an honest man. I desire your Lordship also to think that though I confess I love some things much better than I love your Lordship — as the Queen's service, her quiet and contentment, her honour, her favour, the good of my country, and the like — yet I love few persons better than yourself, both for gratitude's sake and for your own virtues, which cannot hurt but by accident or abuse. Of which my good affection I was ever ready and am ready to yield testimony by any good offices, but with such reservations as yourself cannot but allow; for as I was ever sorry that your Lordship should fly with waxen wings, doubting Icarus's fortune, so for the growing up of your own feathers, specially ostrich's, or any other save of a bird of prey, no man shall be more glad. And this is the axletree whereupon I have turned and shall turn, which to signify to you, though I think you are of yourself persuaded as much, is the cause of my writing; and so I commend your Lordship to God's goodness. From Gray's Inn, this 20th day of July, 1600.

"Your Lordship's most humbly,
"FR. BACON."

To this letter Essex returned an answer of dignified reserve, such as Bacon might himself have dictated —

"MR. BACON, — I can neither expound nor censure your late actions, being ignorant of all of them, save one, and having directed my sight inward only, to examine myself. You do pray me to believe that you only aspire to the conscience and commendation of *bonus civis* and *bonus vir*; and I do faithfully assure you, that while that is your ambition (though your course be active and

mine contemplative), yet we shall both *convenire in codem tertio* and *convenire inter nosipsos*. Your profession of affection and offer of good offices are welcome to me. For answer to them I will say but this, that you have believed I have been kind to you, and you may believe that I cannot be other, either upon humour or my own election. I am a stranger to all poetical conceits, or else I should say somewhat of your poetical example. But this I must say, that I never flew with other wings than desire to merit and confidence in my Sovereign's favour; and when one of these wings failed me I would light nowhere but at my Sovereign's feet, though she suffered me to be bruised with my fall. And till her Majesty, that knows I was never bird of prey, finds it to agree with her will and her service that my wings should be imped again, I have committed myself to the mire. No power but my God's and my Sovereign's can alter this resolution of

"Your retired friend,
"ESSEX."

But after Essex's mad attempt in the city a new state of things arose. The inevitable result was a trial for high treason, a trial of which no one could doubt the purpose and end. The examination of accomplices revealed speeches, proposals, projects, not very intelligible to us in the still imperfectly understood game of intrigue that was going on among all parties at the end of Elizabeth's reign, but quite enough to place Essex at the mercy of the Government and the offended Queen. "The new information," says Mr. Spedding, "had been immediately communicated to Coke and Bacon." Coke, as Attorney-General, of course conducted the prosecution; and the next prominent person on the side of the Crown was not the Solicitor, or any other regular law officer, but Bacon, though holding the very subordinate place of one of the "Learned Counsel."

It does not appear that he thought it strange, that he showed any pain or reluctance, that he sought to be excused. He took it as a matter of course. The part assigned to Bacon in the prosecution was as important as that of Coke; and he played it more skilfully and effectively. Trials in those days were confused

affairs, often passing into a mere wrangle between the judges, lawyers, and lookers-on, and the prisoner at the bar. It was so in this case. Coke is said to have blundered in his way of presenting the evidence, and to have been led away from the point into an altercation with Essex. Probably it really did not much matter; but the trial was getting out of its course and inclining in favour of the prisoner, till Bacon — Mr. Spedding thinks, out of his regular turn — stepped forward and retrieved matters. This is Mr. Spedding's account of what Bacon said and did:

"By this time the argument had drifted so far away from the point that it must have been difficult for a listener to remember what it was that the prisoners were charged with, or how much of the charge had been proved. And Coke, who was all this time the sole speaker on behalf of the Crown, was still following each fresh topic that rose before him, without the sign of an intention or the intimation of a wish to return to the main question and reform the broken ranks of his evidence. Luckily he seems to have been now at a loss what point to take next, and the pause gave Bacon an opportunity of rising. It can hardly have been in pursuance of previous arrangements; for though it was customary in those days to distribute the evidence into parts and to assign several parts to several counsel, there had been no appearance as yet of any part being concluded. It is probable that the course of the trial had upset previous arrangements and confused the parts. At any rate so it was, however it came to pass, that when Cecil and Essex had at last finished their expostulation and parted with charitable prayers, each that the other might be forgiven, then (says our reporter) Mr. Bacon entered into a speech much after this fashion:

"'In speaking of this late and horrible rebellion which hath been in the eyes and ears of all men, I shall save myself much labour in opening and enforcing the points thereof, insomuch as I speak not before a country jury of ignorant men, but before a most honourable assembly of the greatest Peers of the land, whose wisdoms conceive far more than my tongue can utter; yet with your gracious and honourable favours I will presume, if not for information of your Honours, yet for the discharge of my duty, to say thus much. No man can be ignorant, that knows matters of former ages — and all history makes it plain —

that there was never any traitor heard of that durst directly attempt the seat of his liege prince but he always coloured his practices with some plausible pretence. For God hath imprinted such a majesty in the face of a prince that no private man dare approach the person of his sovereign with a traitorous intent. And therefore they run another side course, *oblique et à latere*: some to reform corruptions of the State and religion; some to reduce the ancient liberties and customs pretended to be lost and worn out; some to remove those persons that being in high places make themselves subject to envy; but all of them aim at the overthrow of the State and destruction of the present rulers. And this likewise is the use of those that work mischief of another quality; as Cain, that first murderer, took up an excuse for his fact, shaming to outface it with impudency, thus the Earl made his colour the severing some great men and councillors from her Majesty's favour, and the fear he stood in of his pretended enemies lest they should murder him in his house. Therefore he saith he was compelled to fly into the City for succour and assistance; not much unlike Pisistratus, of whom it was so anciently written how he gashed and wounded himself, and in that sort ran crying into Athens that his life was sought and like to have been taken away; thinking to have moved the people to have pitied him and taken his part by such counterfeited harm and danger; whereas his aim and drift was to take the government of the city into his hands and alter the form thereof. With like pretences of dangers and assaults the Earl of Essex entered the City of London and passed through the bowels thereof, blanching rumours that he should have been murdered and that the State was sold; whereas he had no such enemies, no such dangers: persuading themselves that if they could prevail all would have done well. But now *magna scelera terminantur in hæresin*; for you, my Lord, should know that though princes give their subjects cause of discontent, though they take away the honours they have heaped upon them, though they bring them to a lower estate than they raised them from, yet ought they not to be so forgetful of their allegiance that they should enter into any undutiful act; much less upon rebellion, as you, my Lord, have done. All whatsoever you have or can say in

answer hereof are but shadows. And therefore methinks it were best for you to confess, not to justify.'"

Essex was provoked by Bacon's incredulous sneer about enemies and dangers — "I call forth Mr. Bacon against Mr. Bacon," and referred to the letters which Bacon had written in his name, and in which these dangerous enmities were taken for granted. Bacon, in answer, repeated what he said so often— "That he had spent more time in vain in studying how to make the Earl a good servant to the Queen and State than he had done in anything else." Once more Coke got the proceedings into a tangle, and once more Bacon came forward to repair the miscarriage of his leader.

"'I have never yet seen in any case such favour shown to any prisoner; so many digressions, such delivering of evidence by fractions, and so silly a defence of such great and notorious treasons. May it please your Grace, you have seen how weakly he hath shadowed his purpose and how slenderly he hath answered the objections against him. But, my Lord, I doubt the variety of matters and the many digressions may minister occasion of forgetfulness, and may have severed the judgments of the Lords; and therefore I hold it necessary briefly to recite the Judges' opinions.'

"That being done, he proceeded to this effect:

"'Now put the case that the Earl of Essex's intents were, as he would have it believed, to go only as a suppliant to her Majesty. Shall their petitions be presented by armed petitioners? This must needs bring loss of property to the prince. Neither is it any point of law, as my Lord of Southampton would have it believed, that condemns them of treason. To take secret counsel, to execute it, to run together in numbers armed with weapons — what can be the excuse? Warned by the Lord Keeper, by a herald, and yet persist! Will any simple man take this to be less than treason?'

"The Earl of Essex answered that if he had purposed anything against others than those his private enemies, he would not have stirred with so slender a company. Whereunto Mr. Bacon answered:

“‘It was not the company you carried with you but the assistance you hoped for in the City which you trusted unto. The Duke of Guise thrust himself into the streets of Paris on the day of the Barricades in his doublet and hose, attended only with eight gentlemen, and found that help in the city which (thanks be to God) you failed of here. And what followed? The King was forced to put himself into a pilgrim’s weeds, and in that disguise to steal away to scape their fury. Even such was my Lord’s confidence too, and his pretence the same — an all-hail and a kiss to the City. But the end was treason, as hath been sufficiently proved. But when he had once delivered and engaged himself so far into that which the shallowness of his conceit could not accomplish as he expected, the Queen for her defence taking arms against him, he was glad to yield himself; and thinking to colour his practices, turned his pretexts, and alleged the occasion thereof to proceed from a private quarrel.’

“To this” (adds the reporter) “the Earl answered little. Nor was anything said afterwards by either of the prisoners, either in the thrust-and-parry dialogue with Coke that followed, or when they spoke at large to the question why judgment should not be pronounced, which at all altered the complexion of the case. They were both found guilty and sentence passed in the usual form.”

Bacon’s legal position was so subordinate a place that there must have been a special reason for his employment. It is difficult to avoid the conclusion that, on the part of the Government, Bacon was thus used for the very reason that he had been the friend of Essex. He was not commonly called upon in such prosecutions. He was not employed by Cecil in the Winchester trials of Raleigh, Grey, and Cobham, three years afterwards, nor in those connected with the Gunpowder Plot. He was called upon now because no one could so much damage Essex; and this last proof of his ready service was required by those whose favour, since Essex had gone hopelessly wrong, he had been diligently seeking. And Bacon acquiesced in the demand, apparently without surprise. No record remains to show that he felt any difficulty in playing his part. He had persuaded himself that his public duty, his duty as a good citizen to the Queen

and the commonwealth, demanded of him that he should obey the call to do his best to bring a traitor to punishment.

Public duty has claims on a man as well as friendship, and in many conceivable cases claims paramount to those of friendship. And yet friendship, too, has claims, at least on a man's memory. Essex had been a dear friend, if words could mean anything. He had done more than any man had done for Bacon, generously and nobly, and Bacon had acknowledged it in the amplest terms. Only a year before he had written, "I am as much yours as any man's, and as much yours as any man." It is not, and it was not, a question of Essex's guilt. It may be a question whether the whole matter was not exaggerated as to its purpose, as it certainly was as to its real danger and mischief. We at least know that his rivals dabbled in intrigue and foolish speeches as well as he; that little more than two years afterwards Raleigh and Grey and Cobham were condemned for treason in much the same fashion as he was; that Cecil to the end of his days — with whatever purpose — was a pensioner of Spain. The question was not whether Essex was guilty. The question for Bacon was, whether it was becoming in him, having been what he had been to Essex, to take a leading part in proceedings which were to end in his ruin and death. He was not a judge. He was not a regular law officer like Coke. His only employment had been casual and occasional. He might, most naturally, on the score of his old friendship, have asked to be excused. Condemning, as he did, his friend's guilt and folly, he might have refused to take part in a cause of blood, in which his best friend must perish. He might honestly have given up Essex as incorrigible, and have retired to stand apart in sorrow and silence while the inevitable tragedy was played out. The only answer to this is, that to have declined would have incurred the Queen's displeasure: he would have forfeited any chance of advancement; nay, closely connected as he had been with Essex, he might have been involved in his friend's ruin. But inferior men have marred their fortunes by standing by their friends in not undeserved trouble, and no one knew better than Bacon what was worthy and noble in human action. The choice lay before him. He seems hardly to have gone through any struggle. He persuaded himself that he could not help

himself, under the constraint of his duty to the Queen, and he did his best to get Essex condemned.

And this was not all. The death of Essex was a shock to the popularity of Elizabeth greater than anything that had happened in her long reign. Bacon's name also had come into men's mouths as that of a time-server who played fast and loose with Essex and his enemies, and who, when he had got what he could from Essex, turned to see what he could get from those who put him to death. A justification of the whole affair was felt to be necessary; and Bacon was fixed upon for the distinction and the dishonour of doing it. No one could tell the story so well, and it was felt that he would not shrink from it. Nor did he. In cold blood he sat down to blacken Essex, using his intimate personal knowledge of the past to strengthen his statements against a friend who was in his grave, and for whom none could answer but Bacon himself. It is a well-compacted and forcible account of Essex's misdoings, on which of course the colour of deliberate and dangerous treason was placed. Much of it, no doubt, was true; but even of the facts, and much more of the colour, there was no check to be had, and it is certain that it was an object to the Government to make out the worst. It is characteristic that Bacon records that he did not lose sight of the claims of courtesy, and studiously spoke of "my Lord of Essex" in the draft submitted for correction to the Queen; but she was more unceremonious, and insisted that the "rebel" should be spoken of simply as "Essex."

After a business of this kind, fines and forfeitures flowed in abundantly, and were "usually bestowed on deserving servants or favoured suitors by way of reward;" and Bacon came in for his share. Out of one of the fines he received £1200. "The Queen hath done something for me," he writes to a friendly creditor, "though not in the proportion I had hoped," and he afterwards asked for something more. It was rather under the value of Essex's gift to him in 1594. But she still refused him all promotion. He was without an official place in the Queen's service, and he never was allowed to have it. It is clear that the "Declaration of the Treason of the Earl of Essex," if it justified the Government, did not remove the odium which had fallen on Bacon. Mr. Spedding says that he

can find no signs of it. The proof of it is found in the "Apology" which Bacon found it expedient to write after Elizabeth's death and early in James's reign. He found that the recollection of the way in which he had dealt with his friend hung heavy upon him; men hesitated to trust him in spite of his now recognised ability. Accordingly, he drew up an apology, which he addressed to Lord Mountjoy, the friend, in reality half the accomplice, of Essex, in his wild, ill-defined plan for putting pressure on Elizabeth. It is a clear, able, of course *ex parte* statement of the doings of the three chief actors, two of whom could no longer answer for themselves, or correct and contradict the third. It represents the Queen as implacable and cruel, Essex as incorrigibly and outrageously wilful, proud, and undutiful, Bacon himself as using every effort and device to appease the Queen's anger and suspiciousness, and to bring Essex to a wiser and humbler mind. The picture is indeed a vivid one, and full of dramatic force, of an unrelenting and merciless mistress bent on breaking and bowing down to the dust the haughty spirit of a once-loved but rebellious favourite, whom, though he has deeply offended, she yet wishes to bring once more under her yoke; and of the calm, keen-witted looker-on, watching the dangerous game, not without personal interest, but with undisturbed presence of mind, and doing his best to avert an irreparable and fatal breach. How far he honestly did his best for his misguided friend we can only know from his own report; but there is no reason to think that he did Essex ill service, though he notices in passing an allegation that the Queen in one of her angry fits had charged him with this. But his interest clearly was to make up the quarrel between the Queen and Essex. Bacon would have been a greater man with both of them if he had been able to do so. He had been too deeply in Essex's intimacy to make his new position of mediator, with a strong bias on the Queen's side, quite safe and easy for a man of honourable mind; but a cool-judging and prudent man may well have acted as he represents himself acting without forgetting what he owed to his friend. Till the last great moment of trial there is a good deal to be said for Bacon: a man keenly alive to Essex's faults, with a strong sense of what he owed to the Queen and the State, and with his own reasonable chances of rising greatly prejudiced by Essex's

folly. But at length came the crisis which showed the man, and threw light on all that had passed before, when he was picked out, out of his regular place, to be charged with the task of bringing home the capital charge against Essex. He does not say he hesitated. He does not say that he asked to be excused the terrible office. He did not flinch as the minister of vengeance for those who required that Essex should die. He did his work, we are told by his admiring biographer, better than Coke, and repaired the blunders of the prosecution. He passes over very shortly this part of the business: “It was laid upon me with the rest of my fellows;” yet it is the knot and key of the whole, as far as his own character is concerned. Bacon had his public duty: his public duty may have compelled him to stand apart from Essex. But it was his interest, it was no part of his public duty, which required him to accept the task of accuser of his friend, and in his friend’s direst need calmly to drive home a well-directed stroke that should extinguish chances and hopes, and make his ruin certain. No one who reads his anxious letters about preferment and the Queen’s favour, about his disappointed hopes, about his straitened means and distress for money, about his difficulties with his creditors — he was twice arrested for debt — can doubt that the question was between his own prospects and his friend; and that to his own interest he sacrificed his friend and his own honour.

CHAPTER III.

BACON AND JAMES I.

Bacon's life was a double one. There was the life of high thinking, of disinterested aims, of genuine enthusiasm, of genuine desire to delight and benefit mankind, by opening new paths to wonder and knowledge and power. And there was the put on and worldly life, the life of supposed necessities for the provision of daily bread, the life of ambition and self-seeking, which he followed, not without interest and satisfaction, but at bottom because he thought he must — must be a great man, must be rich, must live in the favour of the great, because without it his great designs could not be accomplished. His original plan of life was disclosed in his letter to Lord Burghley: to get some office with an assured income and not much work, and then to devote the best of his time to his own subjects. But this, if it was really his plan, was gradually changed: first, because he could not get such a place; and next because his connection with Essex, the efforts to gain him the Attorney's place, and the use which the Queen made of him after Essex could do no more for him, drew him more and more into public work, and specially the career of the law. We know that he would not by preference have chosen the law, and did not feel that his vocation lay that way; but it was the only way open to him for mending his fortunes. And so the two lives went on side by side, the worldly one — he would have said, the practical one — often interfering with the life of thought and discovery, and partly obscuring it, but yet always leaving it paramount in his own mind. His dearest and most cherished ideas, the thoughts with which he was most at home and happiest, his deepest and truest ambitions, were those of an enthusiastic and romantic believer in a great discovery just within his grasp. They were such as the dreams and visions of his great Franciscan namesake, and of the imaginative seekers after knowledge in the middle ages, real or mythical, Albert the Great, Cornelius Agrippa, Dr. Faustus; they were the eager,

undoubting hopes of the physical students in Italy and England in his own time, Giordano Bruno, Telesio, Campanella, Gilbert, Galileo, or the founders of the Italian prototype of "Solomon's House" in the *New Atlantis*, the precursor of our Royal Societies, the Academy of the *Lincei* at Rome. Among these meditations was his inner life. But however he may have originally planned his course, and though at times under the influence of disappointment he threatened to retire to Cambridge or to travel abroad, he had bound himself fast to public life, and soon ceased to think of quitting it. And he had a real taste for it — for its shows, its prizes, for the laws and turns of the game, for its debates and vicissitudes. He was no mere idealist or recluse to undervalue or despise the real grandeur of the world. He took the keenest interest in the nature and ways of mankind; he liked to observe, to generalise in shrewd and sometimes cynical epigrams. He liked to apply his powerful and fertile intellect to the practical problems of society and government, to their curious anomalies, to their paradoxical phenomena; he liked to address himself, either as an expounder or a reformer, to the principles and entanglements of English law; he aspired, both as a lecturer and a legislator, to improve and simplify it. It was not beyond his hopes to shape a policy, to improve administration, to become powerful by bringing his sagacity and largeness of thought to the service of the State, in reconciling conflicting forces, in mediating between jealous parties and dangerous claims. And he liked to enter into the humours of a Court; to devote his brilliant imagination and affluence of invention either to devising a pageant which should throw all others into the shade, or a compromise which should get great persons out of some difficulty of temper or pique.

In all these things he was as industrious, as laborious, as calmly persevering and tenacious, as he was in his pursuit of his philosophical speculations. He was a compound of the most adventurous and most diversified ambition, with a placid and patient temper, such as we commonly associate with moderate desires and the love of retirement and an easy life. To imagine and dare anything, and never to let go the object of his pursuit, is one side of him; on the other he is obsequiously desirous to please and fearful of giving offence, the humblest and

most grateful and also the most importunate of suitors, ready to bide his time with an even cheerfulness of spirit, which yet it was not safe to provoke by ill offices and the wish to thwart him. He never misses a chance of proffering his services; he never lets pass an opportunity of recommending himself to those who could help him. He is so bent on natural knowledge that we have a sense of incongruity when we see him engaging in politics as if he had no other interest. He throws himself with such zest into the language of the moralist, the theologian, the historian, that we forget we have before us the author of a new departure in physical inquiry, and the unwearied compiler of tables of natural history. When he is a lawyer, he seems only a lawyer. If he had not been the author of the *Instauratio*, his life would not have looked very different from that of any other of the shrewd and supple lawyers who hung on to the Tudor and Stuart Courts, and who unscrupulously pushed their way to preferment. He claimed to be, in spite of the misgivings of Elizabeth and her ministers, as devoted to public work and as capable of it as any of them. He was ready for anything, for any amount of business, ready, as in everything, to take infinite trouble about it. The law, if he did not like it, was yet no by-work with him; he was as truly ambitious as the men with whom he maintained so keen and for long so unsuccessful a rivalry. He felt bitterly the disappointment of seeing men like Coke and Fleming and Doddridge and Hobart pass before him; he could not, if he had been only a lawyer, have coveted more eagerly the places, refused to him, which they got; only, he had besides a whole train of purposes, an inner and supreme ambition, of which they knew nothing. And with all this there is no apparent consciousness of these manifold and varied interests. He never affected to conceal from himself his superiority to other men in his aims and in the grasp of his intelligence. But there is no trace that he prided himself on the variety and versatility of these powers, or that he even distinctly realized to himself that it was anything remarkable that he should have so many dissimilar objects and be able so readily to pursue them in such different directions.

It is doubtful whether, as long as Elizabeth lived, Bacon could ever have risen above his position among the “Learned Counsel,” an office without patent or

salary or regular employment. She used, him, and he was willing to be used; but he plainly did not appear in her eyes to be the kind of man who would suit her in the more prominent posts of her Government. Unusual and original ability is apt, till it is generally recognised, to carry with it suspicion and mistrust as to its being really all that it seems to be. Perhaps she thought of the possibility of his flying out unexpectedly at some inconvenient pinch, and attempting to serve her interests, not in her way, but in his own; perhaps she distrusted in business and state affairs so brilliant a discourser, whose heart was known, first and above all, to be set on great dreams of knowledge; perhaps those interviews with her in which he describes the counsels which he laid before her, and in which his shrewdness and foresight are conspicuous, may not have been so welcome to her as he imagined; perhaps, it is not impossible, that he may have been too compliant for her capricious taste, and too visibly anxious to please. Perhaps, too, she could not forget, in spite of what had happened, that he had been the friend, and not the very generous friend, of Essex. But, except as to a share of the forfeitures, with which he was not satisfied, his fortunes did not rise under Elizabeth.

Whatever may have been the Queen's feelings towards him, there is no doubt that one powerful influence, which lasted into the reign of James, was steadily adverse to his advancement. Burghley had been strangely niggardly in what he did to help his brilliant nephew; he was going off the scene, and probably did not care to trouble himself about a younger and uncongenial aspirant to service. But his place was taken by his son, Robert Cecil; and Cecil might naturally have been expected to welcome the co-operation of one of his own family who was foremost among the rising men of Cecil's own generation, and who certainly was most desirous to do him service. But it is plain that he early made up his mind to keep Bacon in the background. It is easy to imagine reasons, though the apparent short-sightedness of the policy may surprise us; but Cecil was too reticent and self-controlled a man to let his reasons appear, and his words, in answer to his cousin's applications for his assistance, were always kind, encouraging, and vague. But we must judge by the event, and that makes it clear

that Cecil did not care to see Bacon in high position. Nothing can account for Bacon's strange failure for so long a time to reach his due place in the public service but the secret hostility, whatever may have been the cause, of Cecil.

There was also another difficulty. Coke was the great lawyer of the day, a man whom the Government could not dispense with, and whom it was dangerous to offend. And Coke thoroughly disliked Bacon. He thought lightly of his law, and he despised his refinement and his passion for knowledge. He cannot but have resented the impertinence, as he must have thought it, of Bacon having been for a whole year his rival for office. It is possible that if people then agreed with Mr. Spedding's opinion as to the management of Essex's trial, he may have been irritated by jealousy; but a couple of months after the trial (April 29, 1601) Bacon sent to Cecil, with a letter of complaint, the following account of a scene in Court between Coke and himself:

"*A true remembrance of the abuse I received of Mr. Attorney-General publicly in the Exchequer the first day of term; for the truth whereof I refer myself to all that were present.*

"I moved to have a reseizure of the lands of Geo. Moore, a relapsed recusant, a fugitive and a practising traytor; and showed better matter for the Queen against the discharge by plea, which is ever with a *salvo jure*. And this I did in as gentle and reasonable terms as might be.

"Mr. Attorney kindled at it, and said, '*Mr. Bacon, if you have any tooth against me pluck it out; for it will do you more hurt than all the teeth in your head will do you good.*' I answered coldly in these very words: '*Mr. Attorney, I respect you; I fear you not; and the less you speak of your own greatness, the more I will think of it.*'

"He replied, '*I think scorn to stand upon terms of greatness towards you, who are less than little; less than the least;*' and other such strange light terms he gave me, with that insulting which cannot be expressed.

"Herewith stirred, yet I said no more but this: '*Mr. Attorney, do not depress me so far; for I have been your better, and may be again, when it please the Queen.*'

"With this he spake, neither I nor himself could tell what, as if he had been born Attorney-General; and in the end bade me not meddle with the Queen's business, but with mine own; and that I was unsworn, *etc.* I told him, sworn or unsworn was all one to an honest man; and that I ever set my service first, and myself second; and wished to God that he would do the like.

"Then he said, it were good to clap a *cap. ultegatum* upon my back! To which I only said he could not; and that he was at fault, for he hunted upon an old scent. He gave me a number of disgraceful words besides, which I answered with silence, and showing that I was not moved with them."

The threat of the *capias ultegatum* was probably in reference to the arrest of Bacon for debt in September, 1593. After this we are not surprised at Bacon writing to Coke, "who take to yourself a liberty to disgrace and disable my law, my experience, my discretion," that, "since I missed the Solicitor's place (the rather I think by your means) I cannot expect that you and I shall ever serve as Attorney and Solicitor together, but either serve with another on your remove, or step into some other course." And Coke, no doubt, took care that it should be so. Cecil, too, may possibly have thought that Bacon gave no proof of his fitness for affairs in thus bringing before him a squabble in which both parties lost their tempers.

Bacon was not behind the rest of the world in "the posting of men of good quality towards the King," in the rash which followed the Queen's death, of those who were eager to proffer their services to James, for whose peaceful accession Cecil had so skilfully prepared the way. He wrote to every one who, he thought, could help him: to Cecil, and to Cecil's man— "I pray you, as you find time let him know that he is the personage in the State which I love most;" to Northumberland, "If I may be of any use to your Lordship, by my head, tongue, pen, means, or friends, I humbly pray you to hold me your own;" to the King's Scotch friends and servants, even to Southampton, the friend of Essex, who had been shut up in the Tower since his condemnation with Essex, and who was now released. "This great change," Bacon assured him, "hath wrought in me no other change towards your Lordship than this, that I may safely be now that

which I truly was before." Bacon found in after years that Southampton was not so easily conciliated. But at present Bacon was hopeful: "In mine own particular," he writes, "I have many comforts and assurances; but in mine own opinion the chief is, that the *canvassing world is gone, and the deserving world is come*." He asks to be recommended to the King— "I commend myself to your love and to the well-using of my name, as well in repressing and answering for me, if there be any biting or nibbling at it in that place, as in impressing a good conceit and opinion of me, chiefly in the King, as otherwise in that Court." His pen had been used under the government of the Queen, and he had offered a draft of a proclamation to the King's advisers. But though he obtained an interview with the King, James's arrival in England brought no immediate prospect of improvement in Bacon's fortunes. Indeed, his name was at first inadvertently passed over in the list of Queen's servants who were to retain their places. The first thing we hear of is his arrest a second time for debt; and his letters of thanks to Cecil, who had rendered him assistance, are written in deep depression.

"For my purpose or course I desire to meddle as little as I can in the King's causes, his Majesty now abounding in counsel, and to follow my private thrift and practice, and to marry with some convenient advancement. For as for any ambition, I do assure your Honour, mine is quenched. In the Queen's, my excellent Mistress's, time the *quorum* was small: her service was a kind of freehold, and it was a more solemn time. All those points agreed with my nature and judgment. My ambition now I shall only put upon my pen, whereby I shall be able to maintain memory and merit of the times succeeding.

"Lastly, for this divulged and almost prostituted title of knighthood, I could without charge, by your Honour's mean, be content to have it, both because of this late disgrace and because I have three new knights in my mess in Gray's Inn's commons; and because I have found out an alderman's daughter, an handsome maiden, to my liking."

Cecil, however, seems to have required that the money should be repaid by the day; and Bacon only makes a humble request, which, it might be supposed,

could have been easily granted.

"IT MAY PLEASE YOUR GOOD LORDSHIP, — In answer of your last letter, your money shall be ready before your day: principal, interest, and costs of suit. So the sheriff promised, when I released errors; and a Jew takes no more. The rest cannot be forgotten, for I cannot forget your Lordship's *dum memor ipse mei*; and if there have been *aliquid nimis*, it shall be amended. And, to be plain with your Lordship, that will quicken me now which slackened me before. Then I thought you might have had more use of me than now I suppose you are like to have. Not but I think the impediment will be rather in my mind than in the matter or times. But to do you service I will come out of my religion at any time.

"For my knighthood, I wish the manner might be such as might grace me, since the matter will not; I mean, that I might not be merely gregarious in a troop. The coronation is at hand. It may please your Lordship to let me hear from you speedily. So I continue your Lordship's ever much bounden,

"FR. BACON.
"From Gorhambury, this 16th of July, 1603."

But it was not done. He "obtained his title, but not in a manner to distinguish him. He was knighted at Whitehall two days before the coronation, but had to share the honour with 300 others."

It was not quite true that his "ambition was quenched." For the rest of Cecil's life Cecil was the first man at James's Court; and to the last there was one thing that Bacon would not appear to believe — he did not choose to believe that it was Cecil who kept him back from employment and honour. To the last he persisted in assuming that Cecil was the person who would help, if he could, a kinsman devoted to his interests and profoundly conscious of his worth. To the last he commended his cause to Cecil in terms of unstinted affection and confiding hope. It is difficult to judge of the sincerity of such language. The mere customary language of compliment employed by every one at this time was of a kind which to us sounds intolerable. It seems as if nothing that ingenuity

could devise was too extravagant for an honest man to use, and for a man who respected himself to accept. It must not, indeed, be forgotten that conventionalities, as well as insincerity, differ in their forms in different times; and that insincerity may lurk behind frank and clear words, when they are the fashion, as much as in what is like mere fulsome adulation. But words mean something, in spite of forms and fashions. When a man of great genius writes his private letters, we wish generally to believe on the whole what he says; and there are no limits to the esteem, the honour, the confidence, which Bacon continued to the end to express towards Cecil. Bacon appeared to trust him — appeared, in spite of continued disappointments, to rely on his good-will and good offices. But for one reason or another Bacon still remained in the shade. He was left to employ his time as he would, and to work his way by himself.

He was not idle. He prepared papers which he meant should come before the King, on the pressing subjects of the day. The Hampton Court conference between the Bishops and the Puritan leaders was at hand, and he drew up a moderating paper on the *Pacification of the Church*. The feeling against him for his conduct towards Essex had not died away, and he addressed to Lord Mountjoy that *Apology concerning the Earl of Essex*, so full of interest, so skilfully and forcibly written, so vivid a picture of the Queen's ways with her servants, which has every merit except that of clearing Bacon from the charge of disloyalty to his best friend. The various questions arising out of the relations of the two kingdoms, now united under James, were presenting themselves. They were not of easy solution, and great mischief would follow if they were solved wrongly. Bacon turned his attention to them. He addressed a discourse to the King on the union of the two kingdoms, the first of a series of discussions on the subject which Bacon made peculiarly his own, and which, no doubt, first drew the King's attention and favour to him.

But for the first year of James's reign he was unnoticed by the King, and he was able to give his attention more freely to the great thought and hope of his life. This time of neglect gave him the opportunity of leisurely calling together and examining the ideas which had long had hold of his mind about the state of

human knowledge, about the possibilities of extending it, about the hopes and powers which that new knowledge opened, and about the methods of realising this great prospect. This, the passion of his life, never asleep even in the hottest days of business or the most hopeless days of defeat, must have had full play during these days of suspended public employment. He was a man who was not easily satisfied with his attempts to arrange the order and proportions of his plans for mastering that new world of unknown truth, which he held to be within the grasp of man if he would only dare to seize it; and he was much given to vary the shape of his work, and to try experiments in composition and even style. He wrote and rewrote. Besides what was finally published, there remains a larger quantity of work which never reached the stage of publication. He repeated over and over again the same thoughts, the same images and characteristic sayings. Among these papers is one which sums up his convictions about the work before him, and the vocation to which he had been called in respect of it. It is in the form of a "Proem" to a treatise on the *Interpretation of Nature*. It was never used in his published works; but, as Mr. Spedding says, it has a peculiar value as an authentic statement of what he looked upon as his special business in life. It is this mission which he states to himself in the following paper. It is drawn up in "stately Latin." Mr. Spedding's translation is no unworthy representation of the words of the great Prophet of Knowledge:

"Believing that I was born for the service of mankind, and regarding the care of the Commonwealth as a kind of common property which, like the air and water, belongs to everybody, I set myself to consider in what way mankind might be best served, and what service I was myself best fitted by nature to perform.

"Now among all the benefits that could be conferred upon mankind, I found none so great as the discovery of new arts, endowments, and commodities for the bettering of man's life.... But if a man could succeed, not in striking out some particular invention, however useful, but in kindling a light in nature — a light that should in its very rising touch and illuminate all the border regions that confine upon the circle of our present knowledge; and so spreading further and

further should presently disclose and bring into sight all that is most hidden and secret in the world — that man (I thought) would be the benefactor indeed of the human race — the propagator of man's empire over the universe, the champion of liberty, the conqueror and subduer of necessities.

"For myself, I found that I was fitted for nothing so well as for the study of Truth; as having a mind nimble and versatile enough to catch the resemblances of things (which is the chief point), and at the same time steady enough to fix and distinguish their subtler differences; as being gifted by nature with desire to seek, patience to doubt, fondness to meditate, slowness to assert, readiness to reconsider, carefulness to dispose and set in order; and as being a man that neither affects what is new nor admires what is old, and that hates every kind of imposture. So I thought my nature had a kind of familiarity and relationship with Truth.

"Nevertheless, because my birth and education had seasoned me in business of State; and because opinions (so young as I was) would sometimes stagger me; and because I thought that a man's own country has some special claims upon him more than the rest of the world; and because I hoped that, if I rose to any place of honour in the State, I should have a larger command of industry and ability to help me in my work — for these reasons I both applied myself to acquire the arts of civil life, and commended my service, so far as in modesty and honesty I might, to the favour of such friends as had any influence. In which also I had another motive: for I felt that those things I have spoken of — be they great or small — reach no further than the condition and culture of this mortal life; and I was not without hope (the condition of religion being at that time not very prosperous) that if I came to hold office in the State, I might get something done too for the good of men's souls. When I found, however, that my zeal was mistaken for ambition, and my life had already readied the turning-point, and my breaking health reminded me how ill I could afford to be so slow, and I reflected, moreover, that in leaving undone the good that I could do by myself alone, and applying myself to that which could not be done without the help and consent of others, I was by no means discharging the duty that lay upon me — I

put all those thoughts aside, and (in pursuance of my old determination) betook myself wholly to this work. Nor am I discouraged from it because I see signs in the times of the decline and overthrow of that knowledge and erudition which is now in use. Not that I apprehend any more barbarian invasions (unless possibly the Spanish empire should recover its strength, and having crushed other nations by arms should itself sink under its own weight); but the civil wars which may be expected, I think (judging from certain fashions which have come in of late), to spread through many countries — together with the malignity of sects, and those compendious artifices and devices which have crept into the place of solid erudition — seem to portend for literature and the sciences a tempest not less fatal, and one against which the Printing-office will be no effectual security. And no doubt but that fair-weather learning which is nursed by leisure, blossoms under reward and praise, which cannot withstand the shock of opinion, and is liable to be abused by tricks and quackery, will sink under such impediments as these. Far otherwise is it with that knowledge whose dignity is maintained by works of utility and power. For the injuries, therefore, which should proceed from the times, I am not afraid of them; and for the injuries which proceed from men, I am not concerned. For if any one charge me with seeking to be wise over-much, I answer simply that modesty and civil respect are fit for civil matters; in contemplations nothing is to be respected but Truth. If any one call on me for *works*, and that presently, I tell him frankly, without any imposture at all, that for me — a man not old, of weak health, my hands full of civil business, entering without guide or light upon an argument of all others the most obscure — I hold it enough to have constructed the machine, though I may not succeed in setting it on work.... If, again, any one ask me, not indeed for actual works, yet for definite premises and forecasts of the works that are to be, I would have him know that the knowledge which we now possess will not teach a man even what to *wish*. Lastly — though this is a matter of less moment — if any of our politicians, who used to make their calculations and conjectures according to persons and precedents, must needs interpose his judgment in a thing of this nature, I would but remind him how (according to the ancient fable) the lame man keeping the

course won the race of the swift man who left it; and that there is no thought to be taken about precedents, for the thing is without precedent.

"For myself, my heart is not set upon any of those things which depend upon external accidents. I am not hunting for fame: I have no desire to found a sect, after the fashion of heresiarchs; and to look for any private gain from such an undertaking as this I count both ridiculous and base. Enough for me the consciousness of well-deserving, and those real and effectual results with which Fortune itself cannot interfere."

In 1604 James's first Parliament met, and with it Bacon returned to an industrious public life, which was not to be interrupted till it finally came to an end with his strange and irretrievable fall. The opportunity had come; and Bacon, patient, vigilant, and conscious of great powers and indefatigable energy, fully aware of all the conditions of the time, pushed at once to the front in the House of Commons. He lost no time in showing that he meant to make himself felt. The House of Commons had no sooner met than it was involved in a contest with the Chancery, with the Lords, and finally with the King himself, about its privileges — in this case its exclusive right to judge of the returns of its members. Bacon's time was come for showing the King both that he was willing to do him service, and that he was worth being employed. He took a leading part in the discussions, and was trusted by the House as their spokesman and reporter in the various conferences. The King, in his overweening confidence in his absolute prerogative, had, indeed, got himself into serious difficulty; for the privilege was one which it was impossible for the Commons to give up. But Bacon led the House to agree to an arrangement which saved their rights; and under a cloud of words of extravagant flattery he put the King in good-humour, and elicited from him the spontaneous proposal of a compromise which ended a very dangerous dispute. "The King's voice," said Bacon, in his report to the House, "was the voice of God in man, the good spirit of God in the mouth of man; I do not say the voice of God and not of man; I am not one of Herod's flatterers; a curse fell upon him that said it, a curse on him that suffered it. We

might say, as was said to Solomon, We are glad, O King, that we give account to you, because you discern what is spoken."

The course of this Parliament, in which Bacon was active and prominent, showed the King, probably for the first time, what Bacon was. The session was not so stormy as some of the later ones; but occasions arose which revealed to the King and to the House of Commons the deeply discordant assumptions and purposes by which each party was influenced, and which brought out Bacon's powers of adjusting difficulties and harmonising claims. He never wavered in his loyalty to his own House, where it is clear that his authority was great. But there was no limit to the submission and reverence which he expressed to the King, and, indeed, to his desire to bring about what the King desired, as far as it could be safely done. Dealing with the Commons, his policy was "to be content with the substance and not to stand on the form." Dealing with the King, he was forward to recognise all that James wanted recognised of his kingcraft and his absolute sovereignty. Bacon assailed with a force and keenness which showed what he could do as an opponent, the amazing and intolerable grievances arising out of the survival of such feudal customs as Wardship and Purveyance; customs which made over a man's eldest son and property, during a minority, to the keeping of the King, that is, to a King's favourite, and allowed the King's servants to cut down a man's timber before the windows of his house. But he urged that these grievances should be taken away with the utmost tenderness for the King's honour and the King's purse. In the great and troublesome questions relating to the Union he took care to be fully prepared. He was equally strong on points of certain and substantial importance, equally quick to suggest accommodations where nothing substantial was touched. His attitude was one of friendly and respectful independence. It was not misunderstood by the King. Bacon, who had hitherto been an unsworn and unpaid member of the Learned Counsel, now received his office by patent, with a small salary, and he was charged with the grave business of preparing the work for the Commissioners for the Union of the Kingdoms, in which, when the Commission met, he took a foremost and successful part.

But the Parliament before which their report was to be laid did not meet till ten months after the work of the Commission was done (Dec., 1604 — Nov., 1605). For nearly another year Bacon had no public work. The leisure was used for his own objects. He was interested in history in a degree only second to his interest in nature; indeed, but for the engrossing claims of his philosophy of nature, he might have been the first and one of the greatest of our historians. He addressed a letter to the Chancellor Ellesmere on the deficiencies of British history, and on the opportunities which offered for supplying them. He himself could at present do nothing; "but because there be so many good painters, both for hand and colours, it needeth but encouragement and instructions to give life and light unto it." But he mistook, in this as in other instances, the way in which such things are done. Men do not accomplish such things to order, but because their souls compel them, as he himself was building up his great philosophical structure, in the midst of his ambition and disappointment. And this interval of quiet enabled him to bring out his first public appeal on the subject which most filled his mind. He completed in English the *Two Books of the Advancement of Knowledge*, which were published at a book-shop at the gateway of Gray's Inn in Holborn (Oct., 1605). He intended that it should be published in Latin also; but he was dissatisfied with the ornate translation sent him from Cambridge, and probably he was in a hurry to get the book out. It was dedicated to the King, not merely by way of compliment, but with the serious hope that his interest might be awakened in the subjects which were nearest Bacon's heart. Like other of Bacon's hopes, it was disappointed. The King's studies and the King's humours were not of the kind to make him care for Bacon's visions of the future, or his eager desire to begin at once a novel method of investigating the facts and laws of nature; and the appeal to him fell dead. Bacon sent the book about to his friends with explanatory letters. To Sir T. Bodley he writes:

"I think no man may more truly say with the Psalm, *Multum incola fuit anima mea* [Ps. 120] than myself. For I do confess since I was of any understanding, my mind hath in effect been absent from that I have done; and in absence are many errors which I willingly acknowledge; and among them, this great one

which led the rest: that knowing myself by inward calling to be fitter to hold a book than to play a part, I have led my life in civil causes, for which I was not very fit by nature, and more unfit by the preoccupation of my mind. Therefore, calling myself home, I have now enjoyed myself; whereof likewise I desire to make the world partaker."

To Lord Salisbury, in a note of elaborate compliment, he describes his purpose by an image which he repeats more than once. "I shall content myself to awake better spirits, *like a bell-ringer, which is first up to call others to church*." But the two friends whose judgment he chiefly valued, and who, as on other occasions, were taken into his most intimate literary confidence, were Bishop Andrewes, his "inquisitor," and Toby Matthews, a son of the Archbishop of York, who had become a Roman Catholic, and lived in Italy, seeing a good deal of learned men there, apparently the most trusted of all Bacon's friends.

When Parliament met again in November, 1605, the Gunpowder Plot and its consequences filled all minds. Bacon was not employed about it by Government, and his work in the House was confined to carrying on matters left unfinished from the previous session. On the rumour of legal promotions and vacancies Bacon once more applied to Salisbury for the Solicitorship (March, 1606). But no changes were made, and Bacon was "still next the door." In May, 1606, he did what had for some time been in his thoughts: he married; not the lady whom Essex had tried to win for him, that Lady Hatton who became the wife of his rival Coke, but one whom Salisbury helped him to gain, an alderman's daughter, Alice Barnham, "an handsome maiden," with some money and a disagreeable mother, by her second marriage, Lady Packington. Bacon's curious love of pomp amused the gossips of the day. "Sir Francis Bacon," writes Carleton to Chamberlain, "was married yesterday to his young wench, in Maribone Chapel. He was clad from top to toe in purple, and hath made himself and his wife such store of raiments of cloth of silver and gold that it draws deep into her portion." Of his married life we hear next to nothing: in his *Essay on Marriage* he is not enthusiastic in its praise; almost the only thing we know is that in his will, twenty years afterwards, he showed his dissatisfaction with his wife, who after

his death married again. But it gave him an additional reason, and an additional plea, for pressing for preferment, and in the summer of 1606 the opening came. Coke was made Chief-Justice of the Common Pleas, leaving the Attorney's place vacant. A favourite of Salisbury's, Hobart, became Attorney, and Bacon hoped for some arrangement by which the Solicitor Doddridge might be otherwise provided for, and he himself become Solicitor. Hopeful as he was, and patient of disappointments, and of what other men would have thought injustice and faithlessness, he felt keenly both the disgrace and the inconvenience of so often expecting place, and being so often passed over. While the question was pending, he wrote to the King, the Chancellor, and Salisbury. His letter to the King is a record in his own words of his public services. To the Chancellor, whom he believed to be his supporter, he represented the discredit which he suffered — he was a common gaze and a speech;" "the little reputation which by his industry he gathered, being scattered and taken away by continual disgraces, *every new man coming above me*;" and his wife and his wife's friends were making him feel it. The letters show what Bacon thought to be his claims, and how hard he found it to get them recognised. To the Chancellor he urged, among other things, that time was slipping by —

"I humbly pray your Lordship to consider that time groweth precious with me, and that a married man is seven years elder in his thoughts the first day.... And were it not to satisfy my wife's friends, and to get myself out of being a common gaze and a speech, I protest before God I would never speak word for it. But to conclude, as my honourable Lady your wife was some mean to make me to change the name of another, so if it please you to help me to change my own name, I can be but more and more bounden to you; and I am much deceived if your Lordship find not the King well inclined, and my Lord of Salisbury forward and affectionate."

To Salisbury he writes:

"I may say to your Lordship, in the confidence of your poor kinsman, and of a man by you advanced, *Tu idem fer opem, qui spem dedisti*; for I am sure it was not possible for any living man to have received from another more significant

and comfortable words of hope; your Lordship being pleased to tell me, during the course of my last service, that you would raise me; and that when you had resolved to raise a man, you were more careful of him than himself; and that what you had done for me in my marriage was a benefit to me, but of no use to your Lordship.... And I know, and all the world knoweth, that your Lordship is no dealer of holy water, but noble and real; and on my part I am of a sure ground that I have committed nothing that may deserve alteration. And therefore my hope is your Lordship will finish a good work, and consider that time groweth precious with me, and that I am now *vergentibus annis*. And although I know your fortune is not to need an hundred such as I am, yet I shall be ever ready to give you my best and first fruits, and to supply (as much as in me lieth) worthiness by thankfulness."

Still the powers were deaf to his appeals; at any rate he had to be content with another promise. Considering the ability which he had shown in Parliament, the wisdom and zeal with which he had supported the Government, and the important position which he held in the House of Commons, the neglect of him is unintelligible, except on two suppositions: that the Government, that is Cecil, were afraid of anything but the mere routine of law, as represented by such men as Hobart and Doddridge; or that Coke's hostility to him was unabated, and Coke still too important to be offended.

Bacon returned to work when the Parliament met, November, 1606. The questions arising out of the Union, the question of naturalisation, its grounds and limits, the position of Scotchmen born *before* or *since* the King's accession, the *Antenati* and *Postnati*, the question of a union of laws, with its consequences, were discussed with great keenness and much jealous feeling. On the question of naturalisation Bacon took the liberal and larger view. The immediate union of laws he opposed as premature. He was a willing servant of the House, and the House readily made use of him. He reported the result of conferences, even when his own opinion was adverse to that of the House. And he reported the speeches of such persons as Lord Salisbury, probably throwing into them both

form and matter of his own. At length, “silently, on the 25th of June,” 1607, he was appointed Solicitor-General. He was then forty-seven.

“It was also probably about this time,” writes Mr. Spedding, “that Bacon finally settled the plan of his ‘*Great Instauration*,’ and began to call it by that name.”

CHAPTER IV.

BACON SOLICITOR-GENERAL.

The great thinker and idealist, the great seer of a world of knowledge to which the men of his own generation were blind, and which they could not, even with his help, imagine a possible one, had now won the first step in that long and toilsome ascent to success in life, in which for fourteen years he had been baffled. He had made himself, for good and for evil, a servant of the Government of James I. He was prepared to discharge with zeal and care all his duties. He was prepared to perform all the services which that Government might claim from its servants. He had sought, he had passionately pressed to be admitted within that circle in which the will of the King was the supreme law; after that, it would have been ruin to have withdrawn or resisted. But it does not appear that the thought or wish to resist or withdraw ever presented itself; he had thoroughly convinced himself that in doing what the King required he was doing the part of a good citizen, and a faithful servant of the State and Commonwealth. The two lives, the two currents of purpose and effort, were still there. Behind all the wrangle of the courts and the devising of questionable legal subtleties to support some unconstitutional encroachment, or to outflank the defence of some obnoxious prisoner, the high philosophical meditations still went on; the remembrance of their sweetness and grandeur wrung more than once from the jaded lawyer or the baffled counsellor the complaint, in words which had a great charm for him, *Multum incola fuit anima mea*— "My soul hath long dwelt" where it would not be. But opinion and ambition and the immense convenience of being great and rich and powerful, and the supposed necessities of his condition, were too strong even for his longings to be the interpreter and the servant of nature. There is no trace of the faintest reluctance on his part to be the willing minister of a court of which not only the principal figure, but the arbiter and governing spirit, was to be George Villiers, Duke of Buckingham.

The first leisure that Bacon had after he was appointed Solicitor he used in a characteristic way. He sat down to make a minute stock-taking of his position and its circumstances. In the summer of 1608 he devoted a week of July to this survey of his life, its objects and its appliances; and he jotted down, day by day, through the week, from his present reflections, or he transcribed from former note-books, a series of notes in loose order, mostly very rough and not always intelligible, about everything that could now concern him. This curious and intimate record, which he called *Commentarius Solutus*, was discovered by Mr. Spedding, who not unnaturally had some misgivings about publishing so secret and so ambiguous a record of a man's most private confidences with himself. But there it was, and, as it was known, he no doubt decided wisely in publishing it as it stands; he has done his best to make it intelligible, and he has also done his best to remove any unfavourable impressions that might arise from it. It is singularly interesting as an evidence of Bacon's way of working, of his watchfulness, his industry, his care in preparing himself long beforehand for possible occasions, his readiness to take any amount of trouble about his present duties, his self-reliant desire for more important and difficult ones. It exhibits his habit of self-observation and self-correction, his care to mend his natural defects of voice, manner, and delivery; it is even more curious in showing him watching his own physical constitution and health, in the most minute details of symptoms and remedies, equally with a scientific and a practical object. It contains his estimate of his income, his expenditure, his debts, schedules of lands and jewels, his rules for the economy of his estate, his plans for his new gardens and terraces and ponds and buildings at Gorhambury. He was now a rich man, valuing his property at £24,155 and his income at £4975, burdened with a considerable debt, but not more than he might easily look to wipe out. But, besides all these points, there appear the two large interests of his life — the reform of philosophy, and his ideal of a great national policy. The "greatness of Britain" was one of his favourite subjects of meditation. He puts down in his notes the outline of what should be aimed at to secure and increase it; it is to make the various forces of the great and growing empire work together in harmonious order, without waste,

without jealousy, without encroachment and collision; to unite not only the interests but the sympathies and aims of the Crown with those of the people and Parliament; and so to make Britain, now in peril from nothing but from the strength of its own discordant elements, that "Monarchy of the West" in reality, which Spain was in show, and, as Bacon always maintained, only in show. The survey of the condition of his philosophical enterprise takes more space. He notes the stages and points to which his plans have reached; he indicates, with a favourite quotation or apophthegm— "*Plus ultra*"— "*ausus vana contemnere*"— "*aditus non nisi sub persona infantis*" soon to be familiar to the world in his published writings — the lines of argument, sometimes alternative ones, which were before him; he draws out schemes of inquiry, specimen tables, distinctions and classifications about the subject of Motion, in English interlarded with Latin, or in Latin interlarded with English, of his characteristic and practical sort; he notes the various sources from which he might look for help and co-operation— "of learned men beyond the seas"— "to begin first in France to print it"— "laying for a place to command wits and pens;" he has his eye on rich and childless bishops, on the enforced idleness of State prisoners in the Tower, like Northumberland and Raleigh, on the great schools and universities, where he might perhaps get hold of some college for "Inventors" — as we should say, for the endowment of research. These matters fill up a large space of his notes. But his thoughts were also busy about his own advancement. And to these sheets of miscellaneous memoranda Bacon confided not only his occupations and his philosophical and political ideas, but, with a curious innocent unreserve, the arts and methods which he proposed to use in order to win the favour of the great and to pull down the reputation of his rivals. He puts down in detail how he is to recommend himself to the King and the King's favourites —

"To set on foot and maintain access with his Majesty, Dean of the Chapel, May, Murray. Keeping a course of access at the beginning of every term and vacation, with a memorial. To attend some time his repasts, or to fall into a course of familiar discourse. To find means to win a conceit, not open, but

private, of being affectionate and assured to the Scotch, and fit to succeed Salisbury in his manage in that kind; Lord Dunbar, Duke of Lennox, and Daubiny: secret."

Then, again, of Salisbury —

"Insinuate myself to become privy to my Lord of Salisbury's estate." "To correspond with Salisbury in a habit of natural but no ways perilous boldness, and in vivacity, invention, care to cast and enterprise (but with due caution), for this manner I judge both in his nature freeth the stands, and in his ends pleaseth him best, and promiseth more use of me. I judge my standing out, and not favoured by Northampton, must needs do me good with Salisbury, especially comparative to the Attorney."

The Attorney Hobart filled the place to which Bacon had so long aspired, and which he thought, perhaps reasonably, that he could fill much better. At any rate, one of the points to which he recurs frequently in his notes is to exhort himself to make his own service a continual contrast to the Attorney's— "to have in mind and use the Attorney's weakness," enumerating a list of instances: "Too full of cases and distinctions. Nibbling solemnly, he distinguisheth but apprehends not;" "No gift with his pen in proclamations and the like;" and at last he draws out in a series of epigrams his view of "Hubbard's disadvantages" —

"Better at shift than at drift.... *Subtilitas sine acrimonia*.... No power with the judge.... He will alter a thing but not mend.... He puts into patents and deeds words not of law but of common sense and discourse.... Sociable save in profit.... He doth depopulate mine office; otherwise called inclose.... I never knew any one of so good a speech with a worse pen." ...

Then in a marginal note— "Solemn goose. Stately, leastwise nodd (?) crafty. They have made him believe that he is wondrous wise." And, finally, he draws up a paper of counsels and rules for his own conduct— "*Custumæ aptæ ad Individuum*" — which might supply an outline for an essay on the arts of behaviour proper for a rising official, a sequel to the biting irony of the essays on *Cunning* and *Wisdom for a Man's Self*.

“To furnish my L. of S. with ornaments for public speeches. To make him think how he should be reverenced by a Lord Chancellor, if I were; Princelike.

“To prepare him for matters to be handled in Council or before the King aforehand, and to show him and yield him the fruits of my care.

“To take notes in tables, when I attend the Council, and sometimes to move out of a memorial shewed and seen. To have particular occasions, fit and graceful and continual, to maintain private speech with every the great persons, and sometimes drawing more than one together. *Ex imitatione Att.* This specially in public places, and without care or affectation. At Council table to make good my L. of Salisb. motions and speeches, and for the rest sometimes one sometimes another; chiefly his, that is most earnest and in affection.

“To suppress at once my speaking, with panting and labour of breath and voice. Not to fall upon the main too sudden, but to induce and intermingle speech of good fashion. To use at once upon entrance given of speech, though abrupt, to compose and draw in myself. To free myself at once from payt. (?) of formality and compliment, though with some show of carelessness, pride, and rudeness.”

(And then follows a long list of matters of business to be attended to.)

These arts of a court were not new; it was not new for men to observe them in their neighbours and rivals. What was new was the writing them down, with deliberate candour, among a man’s private memoranda, as things to be done and with the intention of practising them. This of itself, it has been suggested, shows that they were unfamiliar and uncongenial to Bacon; for a man reminds himself of what he is apt to forget. But a man reminds himself also of what seems to him, at the moment, most important, and what he lays most stress upon. And it is clear that these are the rules, rhetorical and ethical, which Bacon laid down for himself in pursuing the second great object of his life — his official advancement; and that, whatever we think of them, they were the means which he deliberately approved.

As long as Salisbury lived, the distrust which had kept Bacon so long in the shade kept him at a distance from the King’s ear, and from influence on his

counsels. Salisbury was the one Englishman in whom the King had become accustomed to confide, in his own conscious strangeness to English ways and real dislike and suspicion of them; Salisbury had an authority which no one else had, both from his relations with James at the end of Elizabeth's reign, and as the representative of her policy and the depositary of its traditions; and if he had lived, things might not, perhaps, have been better in James's government, but many things, probably, would have been different. But while Salisbury was supreme, Bacon, though very alert and zealous, was mainly busied with his official work; and the Solicitor's place had become, as he says, a "mean thing" compared with the Attorney's, and also an extremely laborious place— "one of the painfullest places in the kingdom." Much of it was routine, but responsible and fatiguing routine. But if he was not in Salisbury's confidence, he was prominent in the House of Commons. The great and pressing subject of the time was the increasing difficulties of the revenue, created partly by the inevitable changes of a growing state, but much more by the King's incorrigible wastefulness. It was impossible to realise completely the great dream and longing of the Stuart kings and their ministers to make the Crown independent of parliamentary supplies; but to dispense with these supplies as much as possible, and to make as much as possible of the revenue permanent, was the continued and fatal policy of the Court. The "Great Contract" — a scheme by which, in return for the surrender by the Crown of certain burdensome and dangerous claims of the Prerogative, the Commons were to assure a large compensating yearly income to the Crown — was Salisbury's favourite device during the last two years of his life. It was not a prosperous one. The bargain was an ill-imagined and not very decorous transaction between the King and his people. Both parties were naturally jealous of one another, suspicious of underhand dealing and tacit changes of terms, prompt to resent and take offence, and not easy to pacify when they thought advantage had been taken; and Salisbury, either by his own fault, or by yielding to the King's canny shiftiness, gave the business a more haggling and huckstering look than it need have had. Bacon, a subordinate of the Government, but a very important person in the Commons,

did his part, loyally, as it seems, and skilfully in smoothing differences and keeping awkward questions from making their appearance. Thus he tried to stave off the risk of bringing definitely to a point the King's cherished claim to levy "impositions," or custom duties, on merchandise, by virtue of his prerogative — a claim which he warned the Commons not to dispute, and which Bacon, maintaining it as legal in theory, did his best to prevent them from discussing, and to persuade them to be content with restraining. Whatever he thought of the "Great Contract," he did what was expected of him in trying to gain for it fair play. But he made time for other things also. He advised, and advised soundly, on the plantation and finance of Ireland. It was a subject in which he took deep interest. A few years later, with only too sure a foresight, he gave the warning, "lest Ireland civil become more dangerous to us than Ireland savage." He advised — not soundly in point of law, but curiously in accordance with modern notions — about endowments; though, in this instance, in the famous will case of Thomas Sutton, the founder of the Charter House, his argument probably covered the scheme of a monstrous job in favour of the needy Court. And his own work went on in spite of the pressure of the Solicitor's place. To the first years of his official life belong three very interesting fragments, intended to find a provisional place in the plan of the "Great Instauration." To his friend Toby Matthews, at Florence, he sent in manuscript the great attack on the old teachers of knowledge, which is perhaps the most brilliant, and also the most insolently unjust and unthinking piece of rhetoric ever composed by him — the *Redargutio Philosophiarum*.

"I send you at this time the only part which hath any harshness; and yet I framed to myself an opinion, that whosoever allowed well of that preface which you so much commend, will not dislike, or at least ought not to dislike, this other speech of preparation; for it is written out of the same spirit, and out of the same necessity. Nay it doth more fully lay open that the question between me and the ancients is not of the virtue of the race, but of the rightness of the way. And to speak truth, it is to the other but as *palma* to *pugnus*, part of the same thing more large.... Myself am like the miller of Huntingdon, that was wont to pray for

peace amongst the willows; for while the winds blew, the wind-mills wrought, and the water-mill was less customed. So I see that controversies of religion must hinder the advancement of sciences. Let me conclude with my perpetual wish towards yourself, that the approbation of yourself by your own discreet and temperate carriage, may restore you to your country, and your friends to your society. And so I commend you to God's goodness.

"Gray's Inn, this 10th of October, 1609."

To Bishop Andrewes he sent, also in manuscript, another piece, belonging to the same plan — the deeply impressive treatise called *Visa et Cogitata* — what Francis Bacon had seen of nature and knowledge, and what he had come by meditation to think of what he had seen. The letter is not less interesting than the last, in respect to the writer's purposes, his manner of writing, and his relations to his correspondent.

"MY VERY GOOD LORD, — Now your Lordship hath been so long in the church and the palace disputing between kings and popes, methinks you should take pleasure to look into the field, and refresh your mind with some matter of philosophy, though that science be now through age waxed a child again, and left to boys and young men; and because you were wont to make me believe you took liking to my writings, I send you some of this vacation's fruits, and thus much more of my mind and purpose. I hasten not to publish; perishing I would prevent. And I am forced to respect as well my times as the matter. For with me it is thus, and I think with all men in my case, if I bind myself to an argument, it loadeth my mind; but if I rid my mind of the present cogitation, it is rather a recreation. This hath put me into these miscellanies, which I purpose to suppress, if God give me leave to write a just and perfect volume of philosophy, which I go on with, though slowly. I send not your Lordship too much, lest it may glut you. Now let me tell you what my desire is. If your Lordship be so good now as when you were the good Dean of Westminster, my request to you is, that not by pricks, but by notes, you would mark unto me whatsoever shall seem unto you either not current in the style, or harsh to credit and opinion, or inconvenient for the person of the writer; for no man can be judge and party, and when our minds

judge by reflection of ourselves, they are more subject to error. And though for the matter itself my judgement be in some things fixed, and not accessible by any man's judgement that goeth not my way, yet even in those things the admonition of a friend may make me express myself diversly. I would have come to your Lordship, but that I am hastening to my house in the country. And so I commend your Lordship to God's goodness."

There was yet another production of this time, of which we have a notice from himself in a letter to Toby Matthews, the curious and ingenious little treatise on the *Wisdom of the Ancients*, "one of the most popular of his works," says Mr. Spedding, "in his own and in the next generation," but of value to us mainly for its quaint poetical colour, and the unexpected turns, like answers to a riddle, given to the ancient fables. When this work was published, it was the third time that he had appeared as an author in print. He thus writes about it and himself:

"MR. MATTHEWS, — I do heartily thank you for your letter of the 24th of August from Salamanca; and in recompense thereof I send you a little work of mine that hath begun to pass the world. They tell me my Latin is turned into silver, and become current. Had you been here, you should have been my inquisitor before it came forth; but I think the greatest inquisitor in Spain will allow it.... My great work goeth forward, and, after my manner, I alter ever when I add. So that nothing is finished till all be finished.

"From Gray's Inn, the 17th of February, 1610."

In the autumn of 1611 the Attorney-General was ill, and Bacon reminded both the King and Salisbury of his claim. He was afraid, he writes to the King, with an odd forgetfulness of the persistency and earnestness of his applications, "that *by reason of my slowness to sue*, and apprehend occasions upon the sudden, keeping one plain course of painful service, I may *in fine dierum* be in danger to be neglected and forgotten." The Attorney recovered, but Bacon, on New Year's Tide of 1611/12, wrote to Salisbury to thank him for his good-will. It is the last letter of Bacon's to Salisbury which has come down to us.

“IT MAY PLEASE YOUR GOOD LORDSHIP, — I would entreat the new year to answer for the old, in my humble thanks to your Lordship, both for many your favours, and chiefly that upon the occasion of Mr. Attorney’s infirmity I found your Lordship even as I would wish. This doth increase a desire in me to express my thankful mind to your Lordship; hoping that though I find age and decays grow upon me, yet I may have a flash or two of spirit left to do you service. And I do protest before God, without compliment or any light vein of mind, that if I knew in what course of life to do you best service, I would take it, and make my thoughts, which now fly to many pieces, be reduced to that center. But all this is no more than I am, which is not much, but yet the entire of him that is—”

In the following May (May 24, 1612) Salisbury died. From this date James passed from government by a minister, who, whatever may have been his faults, was laborious, public-spirited, and a statesman, into his own keeping and into the hands of favourites, who cared only for themselves. With Cecil ceased the traditions of the days of Elizabeth and Burghley, in many ways evil and cruel traditions, but not ignoble and sordid ones; and James was left without the stay, and also without the check, which Cecil’s power had been to him. The field was open for new men and new ways; the fashions and ideas of the time had altered during the last ten years, and those of the Queen’s days had gone out of date. Would the new turn out for the better or the worse? Bacon, at any rate, saw the significance of the change and the critical eventfulness of the moment. It was his habit of old to send memorials of advice to the heads of the Government, apparently without such suggestions seeming more intrusive or officious than a leading article seems now, and perhaps with much the same effect. It was now a time to do so, if ever; and he was in an official relation to the King which entitled him to proffer advice. He at once prepared to lay his thoughts before the King, and to suggest that he could do far better service than Cecil, and was ready to take his place. The policy of the “Great Contract” had certainly broken down, and the King, under Cecil’s guidance, had certainly not known how to manage an English parliament. In writing to the King he found it hard to satisfy himself.

Several draft letters remain, and it is not certain which of them, if any, was sent. But immediately on Salisbury's death he began, May 29th, a letter in which he said that he had never yet been able to show his affection to the King, "having been as a hawk tied to another's fist;" and if, "as was said to one that spake great words, *Amice, verba tua desiderant civitatem*, your Majesty say to me, *Bacon, your words require a place to speak them*," yet that "place or not place" was with the King. But the draft breaks off abruptly, and with the date of the 31st we have the following:

"Your Majesty hath lost a great subject and a great servant. But if I should praise him in propriety, I should say that he was a fit man to keep things from growing worse, but no very fit man to reduce things to be much better. For he loved to have the eyes of all Israel a little too much upon himself, and to have all business still under the hammer, and like clay in the hands of the potter, to mould it as he thought good; so that he was more *in operatione* than *in opere*. And though he had fine passages of action, yet the real conclusions came slowly on. So that although your Majesty hath grave counsellors and worthy persons left, yet you do as it were turn a leaf, wherein if your Majesty shall give a frame and constitution to matters, before you place the persons, in my simple opinion it were not amiss. But the great matter and most instant for the present, is the consideration of a Parliament, for two effects: the one for the supply of your estate, the other for the better knitting of the hearts of your subjects unto your Majesty, according to your infinite merit; for both which, Parliaments have been and are the antient and honourable remedy.

"Now because I take myself to have a little skill in that region, as one that ever affected that your Majesty mought in all your causes not only prevail, but prevail with satisfaction of the inner man; and though no man can say but I was a perfect and peremptory royalist, yet every man makes me believe that I was never one hour out of credit with the Lower House; my desire is to know whether your Majesty will give me leave to meditate and propound unto you some preparative remembrances touching the future Parliament."

Whether he sent this or not, he prepared another draft. What had happened in the mean while we know not, but Bacon was in a bitter mood, and the letter reveals, for the first time, what was really in Bacon's heart about the "great subject and great servant," of whom he had just written so respectfully, and with whom he had been so closely connected for most of his life. The fierceness which had been gathering for years of neglect and hindrance under that placid and patient exterior broke out. He offered himself as Cecil's successor in business of State. He gave his reason for being hopeful of success. Cecil's bitterest enemy could not have given it more bitterly.

"My principal end being to do your Majesty service, I crave leave to make at this time to your Majesty this most humble oblation of myself. I may truly say with the psalm, *Multum incola fuit anima mea*, for my life hath been conversant in things wherein I take little pleasure. Your Majesty may have heard somewhat that my father was an honest man, and somewhat you may have seen of myself, though not to make any true judgement by, because I have hitherto had only *potestatem verborum*, nor that neither. I was three of my young years bred with an ambassador in France, and since I have been an old truant in the school-house of your council-chamber, though on the second form, yet longer than any that now sitteth hath been upon the head form. If your Majesty find any aptness in me, or if you find any scarcity in others, whereby you may think it fit for your service to remove me to business of State, although I have a fair way before me for profit (and by your Majesty's grace and favour for honour and advancement), and in a course less exposed to the blasts of fortune, *yet now that he is gone, quo vivente virtutibus certissimum exitium*, I will be ready as a chessman to be wherever your Majesty's royal hand shall set me. Your Majesty will bear me witness, I have not suddenly opened myself thus far. I have looked upon others, I see the exceptions, I see the distractions, and I fear Tacitus will be a prophet, *magis alii homines quam alii mores*. I know mine own heart, and I know not whether God that hath touched my heart with the affection may not touch your royal heart to discern it. Howsoever, I shall at least go on honestly in mine ordinary course, and supply the rest in prayers for you, remaining, etc."

This is no hasty outburst. In a later paper on the true way of retrieving the disorders of the King's finances, full of large and wise counsel, after advising the King not to be impatient, and assuring him that a state of debt is not so intolerable— "for it is no new thing for the greatest Kings to be in debt," and all the great men of the Court had been in debt without any "manner of diminution of their greatness" — he returns to the charge in detail against Salisbury and the Great Contract.

"My second prayer is, that your Majesty — in respect to the hasty freeing of your state — would not descend to any means, or degree of means, which carrieth not a symmetry with your Majesty and greatness. *He is gone from whom those courses did wholly flow.* To have your wants and necessities in particular as it were hanged up in two tablets before the eyes of your lords and commons, to be talked of for four months together; To have all your courses to help yourself in revenue or profit put into printed books, which were wont to be held *arcana imperii*; To have such worms of aldermen to lend for ten in the hundred upon good assurance, and with such entreaty (?) as if it should save the bark of your fortune; To contract still where mought be had the readiest payment, and not the best bargain; To stir a number of projects for your profit, and then to blast them, and leave your Majesty nothing but the scandal of them; To pretend even carriage between your Majesty's rights and ease of the people, and to satisfy neither. These courses and others the like I hope are gone with the deviser of them; which have turned your Majesty to inestimable prejudice."

And what he thought of saying, but on further consideration struck out, was the following. It is no wonder that he struck it out, but it shows what he felt towards Cecil.

"I protest to God, though I be not superstitious, when I saw your M.'s book against Vorstius and Arminius, and noted your zeal to deliver the majesty of God from the vain and indign comprehensions of heresy and degenerate philosophy, as you had by your pen formerly endeavoured to deliver kings from the usurpation of Rome, *perculsit illico animum* that God would set shortly upon

you some visible favour, *and let me not live if I thought not of the taking away of that man*."

And from this time onwards he scarcely ever mentions Cecil's name in his correspondence with James but with words of condemnation, which imply that Cecil's mischievous policy was the result of private ends. Yet this was the man to whom he had written the "New Year's Tide" letter six months before; a letter which is but an echo to the last of all that he had been accustomed to write to Cecil when asking assistance or offering congratulation. Cecil had, indeed, little claim on Bacon's gratitude; he had spoken him fair in public, and no doubt in secret distrusted and thwarted him. But to the last Bacon did not choose to acknowledge this. Had James disclosed something of his dead servant, who left some strange secrets behind him, which showed his unsuspected hostility to Bacon? Except on this supposition (but there is nothing to support it), no exaggeration of the liberty allowed to the language of compliment is enough to clear Bacon of an insincerity which is almost inconceivable in any but the meanest tools of power.

"I assure myself," wrote Bacon to the King, "your Majesty taketh not me for one of a busy nature; for my estate being free from all difficulties, and I having such a large field for contemplation, as I have partly and shall much more make manifest unto your Majesty and the world, to occupy my thoughts, nothing could make me active but love and affection." So Bacon described his position with questionable accuracy — for his estate was not "free from difficulties" — in the new time coming. He was still kept out of the inner circle of the Council; but from the moment of Salisbury's death he became a much more important person. He still sued for advancement, and still met with disappointment; the "mean men" still rose above him. The lucrative place of Master of the Wards was vacated by Salisbury's death. Bacon was talked of for it, and probably expected it, for he drew up new rules for it, and a speech for the new master; but the office and the speech went to Sir George Carey. Soon after Sir George Carey died. Bacon then applied for it through the new favourite, Rochester. "He was so confident of the place that he put most of his men into new cloaks;" and the

world of the day amused itself at his disappointment, when the place was given to another "mean man," Sir Walter Cope, of whom the gossips wrote that if the "last two Treasurers could look out of their graves to see those successors in that place, they would be out of countenance with themselves, and say to the world *quantum mutatus*." But Bacon's hand and counsel appear more and more in important matters — the improvement of the revenue; the defence of extreme rights of the prerogative in the case against Whitelocke; the great question of calling a parliament, and of the true and "princely" way of dealing with it. His confidential advice to the King about calling a parliament was marked by his keen perception of the facts of the situation; it was marked too by his confident reliance on skilful indirect methods and trust in the look of things; it bears traces also of his bitter feeling against Salisbury, whom he charges with treacherously fomenting the opposition of the last Parliament. There was no want of worldly wisdom in it; certainly it was more adapted to James's ideas of state-craft than the simpler plan of Sir Henry Nevill, that the King should throw himself frankly on the loyalty and good-will of Parliament. And thus he came to be on easy terms with James, who was quite capable of understanding Bacon's resource and nimbleness of wit. In the autumn of 1613 the Chief-Justiceship of the King's Bench became vacant. Bacon at once gave the King reasons for sending Coke from the Common Pleas — where he was a check on the prerogative — to the King's Bench, where he could do less harm; while Hobart went to the Common Pleas. The promotion was obvious, but the Common Pleas suited Coke better, and the place was more lucrative. Bacon's advice was followed. Coke, very reluctantly, knowing well who had given it, and why, "not only weeping himself but followed by the tears" of all the Court of Common Pleas, moved up to the higher post. The Attorney Hobart succeeded, and Bacon at last became Attorney (October 27, 1613). In Chamberlain's gossip we have an indication, such as occurs only accidentally, of the view of outsiders: "There is a strong apprehension that little good is to be expected by this change, and that Bacon may prove a dangerous instrument."

CHAPTER V.

BACON ATTORNEY-GENERAL AND CHANCELLOR.

Thus, at last, at the age of fifty-two, Bacon had gained the place which Essex had tried to get for him at thirty-two. The time of waiting had been a weary one, and it is impossible not to see that it had been hurtful to Bacon. A strong and able man, very eager to have a field for his strength and ability, who is kept out of it, as he thinks unfairly, and is driven to an attitude of suppliant dependency in pressing his claim on great persons who amuse him with words, can hardly help suffering in the humiliating process. It does a man no good to learn to beg, and to have a long training in the art. And further, this long delay kept up the distraction of his mind between the noble work on which his soul was bent, and the necessities of that "civil" or professional and political life by which he had to maintain his estate. All the time that he was "canvassing" (it is his own word) for office, and giving up his time and thoughts to the work which it involved, the great *Instauration* had to wait his hours of leisure; and his exclamation, so often repeated, *Multum incola fuit anima mea*, bears witness to the longings that haunted him in his hours of legal drudgery, or in the service of his not very thankful employers. Not but that he found compensation in the interest of public questions, in the company of the great, in the excitement of state-craft and state employment, in the pomp and enjoyment of court life. He found too much compensation; it was one of his misfortunes. But his heart was always sound in its allegiance to knowledge; and if he had been fortunate enough to have risen earlier to the greatness which he aimed at as a vantage-ground for his true work, or if he had had self-control to have dispensed with wealth and position — if he had escaped the long necessity of being a persistent and still baffled suitor — we might have had as a completed whole what we have now only in great fragments, and we should have been spared the blots which mar a career which ought to have been a noble one.

The first important matter that happened after Bacon's new appointment was the Essex divorce case, and the marriage of Lady Essex with the favourite whom Cecil's death had left at the height of power, and who from Lord Rochester was now made Earl of Somerset. With the divorce, the beginning of the scandals and tragedies of James's reign, Bacon had nothing to do. At the marriage which followed Bacon presented as his offering a masque, performed by the members of Gray's Inn, of which he bore the charges, and which cost him the enormous sum of £2000. Whether it were to repay his obligations to the Howards, or in lieu of a "fee" to Rochester, who levied toll on all favours from the King, it can hardly be said, as has been suggested, to be a protest against the great abuse of the times, the sale of offices for money. The "very splendid trifle, the Masque of Flowers," was one form of the many extravagant tributes paid but too willingly to high-handed worthlessness, of which the deeper and darker guilt was to fill all faces with shame two years afterwards.

As Attorney, Bacon had to take a much more prominent part in affairs, legal, criminal, constitutional, administrative, than he had yet been allowed to have. We know that it was his great object to show how much more active and useful an Attorney he could be than either Coke or Hobart; and as far as unflagging energy and high ability could make a good public servant, he fully carried out his purpose. In Parliament, the "addled Parliament" of 1614, in which he sat for the University of Cambridge, he did his best to reconcile what were fast becoming irreconcilable, the claims and prerogatives of an absolute king, irritable, suspicious, exacting, prodigal, with the ancient rights and liberties, growing stronger in their demands by being denied, resisted, or outwitted, of the popular element in the State. In the trials, which are so large and disagreeable a part of the history of these years — trials arising out of violent words provoked by the violent acts of power, one of which, Peacham's, became famous, because in the course of it torture was resorted to, or trials which witnessed to the corruption of the high society of the day, like the astounding series of arraignments and condemnations following on the discoveries relating to Overbury's murder, which had happened just before the Somerset marriage —

Bacon had to make the best that he could for the cruel and often unequal policy of the Court; and Bacon must take his share in the responsibility for it. An effort on James's part to stop duelling brought from Bacon a worthier piece of service, in the shape of an earnest and elaborate argument against it, full of good sense and good feeling, but hopelessly in advance of the time. On the many questions which touched the prerogative, James found in his Attorney a ready and skilful advocate of his claims, who knew no limit to them but in the consideration of what was safe and prudent to assert. He was a better and more statesmanlike counsellor, in his unceasing endeavours to reconcile James to the expediency of establishing solid and good relations with his Parliament, and in his advice as to the wise and hopeful ways of dealing with it. Bacon had no sympathy with popular wants and claims; of popularity, of all that was called popular, he had the deepest suspicion and dislike; the opinions and the judgment of average men he despised, as a thinker, a politician, and a courtier; the "malignity of the people" he thought great. "I do not love," he says, "the word *people*." But he had a high idea of what was worthy of a king, and was due to the public interests, and he saw the folly of the petty acts and haughty words, the use of which James could not resist. In his new office he once more urged on, and urged in vain, his favourite project for revising, simplifying, and codifying the law. This was a project which would find little favour with Coke, and the crowd of lawyers who venerated him — men whom Bacon viewed with mingled contempt and apprehension both in the courts and in Parliament where they were numerous, and whom he more than once advised the King to bridle and keep "in awe." Bacon presented his scheme to the King in a Proposition, or, as we should call it, a Report. It is very able and interesting; marked with his characteristic comprehensiveness and sense of practical needs, and with a confidence in his own knowledge of law which contrasts curiously with the current opinion about it. He speaks with the utmost honour of Coke's work, but he is not afraid of a comparison with him. "I do assure your Majesty," he says, "I am in good hope that when Sir Edward Coke's Reports and my Rules and Decisions shall come to posterity, there will be (whatever is now thought) question who was the greater

lawyer." But the project, though it was entertained and discussed in Parliament, came to nothing. No one really cared about it except Bacon.

But in these years (1615 and 1616) two things happened of the utmost consequence to him. One was the rise, more extravagant than anything that England had seen for centuries, and in the end more fatal, of the new favourite, who from plain George Villiers became the all-powerful Duke of Buckingham. Bacon, like the rest of the world, saw the necessity of bowing before him; and Bacon persuaded himself that Villiers was pre-eminently endowed with all the gifts and virtues which a man in his place would need. We have a series of his letters to Villiers; they are of course in the complimentary vein which was expected; but if their language is only compliment, there is no language left for expressing what a man wishes to be taken for truth. The other matter was the humiliation, by Bacon's means and in his presence, of his old rival Coke. In the dispute about jurisdiction, always slumbering and lately awakened and aggravated by Coke, between the Common Law Courts and the Chancery, Coke had threatened the Chancery with Præmunire. The King's jealousy took alarm, and the Chief-Justice was called before the Council. There a decree, based on Bacon's advice and probably drawn up by him, peremptorily overruled the legal doctrine maintained by the greatest and most self-confident judge whom the English courts had seen. The Chief-Justice had to acquiesce in this reading of the law; and then, as if such an affront were not enough, Coke was suspended from his office, and, further, enjoined to review and amend his published reports, where they were inconsistent with the view of law which on Bacon's authority the Star Chamber had adopted (June, 1616). This he affected to do, but the corrections were manifestly only colourable; his explanations of his legal heresies against the prerogative, as these heresies were formulated by the Chancellor and Bacon, and presented to him for recantation, were judged insufficient; and in a decree, prefaced by reasons drawn up by Bacon, in which, besides Coke's errors of law, his "deceit, contempt, and slander of the Government," his "perpetual turbulent carriage," and his affectation of popularity, were noted — he was removed from his office (Nov., 1616). So, for

the present, the old rivalry had ended in a triumph for Bacon. Bacon, whom Coke had so long headed in the race, whom he had sneered at as a superficial pretender to law, and whose accomplishments and enthusiasm for knowledge he utterly despised, had not only defeated him, but driven him from his seat with dishonour. When we remember what Coke was, what he had thought of Bacon, and how he prized his own unique reputation as a representative of English law, the effects of such a disgrace on a man of his temper cannot easily be exaggerated.

But for the present Bacon had broken through the spell which had so long kept him back. He won a great deal of the King's confidence, and the King was more and more ready to make use of him, though by no means equally willing to think that Bacon knew better than himself. Bacon's view of the law, and his resources of argument and expression to make it good, could be depended upon in the keen struggle to secure and enlarge the prerogative which was now beginning. In the prerogative both James and Bacon saw the safety of the State and the only reasonable hope of good government; but in Bacon's larger and more elevated views of policy — of a policy worthy of a great king, and a king of England — James was not likely to take much interest. The memorials which it was Bacon's habit to present on public affairs were wasted on one who had so little to learn from others — so he thought and so all assured him — about the secrets of empire. Still they were proofs of Bacon's ready mind; and James, even when he disagreed with Bacon's opinion and arguments, was too clever not to see their difference from the work of other men. Bacon rose in favour; and from the first he was on the best of terms with Villiers. He professed to Villiers the most sincere devotion. According to his custom he presented him with a letter of wise advice on the duties and behaviour of a favourite. He at once began, and kept up with him to the end, a confidential correspondence on matters of public importance. He made it clear that he depended upon Villiers for his own personal prospects, and it had now become the most natural thing that Bacon should look forward to succeeding the Lord Chancellor, Ellesmere, who was fast failing. Bacon had already (Feb. 12, 1615/16). in terms which seem strange to

us, but were less strange then, set forth in a letter to the King the reasons why he should be Chancellor; criticising justly enough, only that he was a party interested, the qualifications of other possible candidates, Coke, Hobart, and the Archbishop Abbott. Coke would be "an overruling nature in an overruling place," and "popular men were no sure mounters for your Majesty's saddle." Hobart was incompetent. As to Abbott, the Chancellor's place required "a whole man," and to have both jurisdiction, spiritual and temporal, "was fit only for a king." The promise that Bacon should have the place came to him three days afterwards through Villiers. He acknowledged it in a burst of gratitude (Feb. 15, 1615/16). "I will now wholly rely on your excellent and happy self.... I am yours surer to you than my own life. For, as they speak of the Turquoise stone in a ring, I will break into twenty pieces before you bear the least fall." They were unconsciously prophetic words. But Ellesmere lasted longer than was expected. It was not till a year after this promise that he resigned. On the 7th of March, 1616/17, Bacon received the seals. He expresses his obligations to Villiers, now Lord Buckingham, in the following letter:

"MY DEAREST LORD, — It is both in cares and kindness that small ones float up to the tongue, and great ones sink down into the heart with silence. Therefore I could speak little to your Lordship to-day, neither had I fit time; but I must profess thus much, that in this day's work you are the truest and perfectest mirror and example of firm and generous friendship that ever was in court. And I shall count every day lost, wherein I shall not either study your well-doing in thought, or do your name honour in speech, or perform you service in deed. Good my Lord, account and accept me your most bounden and devoted friend and servant of all men living,

"March 7, 1616 (*i.e.* 1616/1617).
FR. BACON, C.S."

He himself believed the appointment to be a popular one. "I know I am come in," he writes to the King soon after, "with as strong an envy of some particulars

as with the love of the general." On the 7th of May, 1617, he took his seat in Chancery with unusual pomp and magnificence, and set forth, in an opening speech, with all his dignity and force, the duties of his great office and his sense of their obligation. But there was a curious hesitation in treating him as other men were treated in like cases. He was only "Lord Keeper." It was not till the following January (1617/18) that he received the office of Lord Chancellor. It was not till half a year afterwards that he was made a Peer. Then he became Baron Verulam (July, 1618), and in January, 1620/21, Viscount St. Alban's.

From this time Bacon must be thought of, first and foremost, as a Judge in the great seat which he had so earnestly sought. It was the place not merely of law, which often tied the judge's hands painfully, but of true justice, when law failed to give it. Bacon's ideas of the duties of a judge were clear and strong, as he showed in various admirable speeches and charges: his duties as regards his own conduct and reputation; his duties in keeping his subordinates free from the taint of corruption. He was not ignorant of the subtle and unacknowledged ways in which unlawful gains may be covered by custom, and an abuse goes on because men will not choose to look at it. He entered on his office with the full purpose of doing its work better than it had ever been done. He saw where it wanted reforming, and set himself at once to reform. The accumulation and delay of suits had become grievous; at once he threw his whole energy into the task of wiping out the arrears which the bad health of his predecessor and the traditional sluggishness of the court had heaped up. In exactly three months from his appointment he was able to report that these arrears had been cleared off. "This day" (June 8, 1617), he writes to Buckingham, "I have made even with the business of the kingdom for common justice. Not one cause unheard. The lawyers drawn dry of all the motions they were to make. Not one petition unheard. And this I think could not be said in our time before."

The performance was splendid, and there is no reason to think that the work so rapidly done was not well done. We are assured that Bacon's decisions were unquestioned, and were not complained of. At the same time, before this allegation is accepted as conclusive proof of the public satisfaction, it must be

remembered that the question of his administration of justice, which was at last to assume such strange proportions, has never been so thoroughly sifted as, to enable us to pronounce upon it, it should be. The natural tendency of Bacon's mind would undoubtedly be to judge rightly and justly; but the negative argument of the silence at the time of complainants, in days when it was so dangerous to question authority, and when we have so little evidence of what men said at their firesides, is not enough to show that he never failed.

But the serious thing is that Bacon subjected himself to two of the most dangerous influences which can act on the mind of a judge — the influence of the most powerful and most formidable man in England, and the influence of presents, in money and other gifts. From first to last he allowed Buckingham, whom no man, as Bacon soon found, could displease except at his own peril, to write letters to him on behalf of suitors whose causes were before him; and he allowed suitors, not often while the cause was pending, but sometimes even then, to send him directly, or through his servants, large sums of money. Both these things are explained. It would have been characteristic of Bacon to be confident that he could defy temptation: these habits were the fashion of the time, and everybody took them for granted; Buckingham never asked his good offices beyond what Bacon thought just and right, and asked them rather for the sake of expedition than to influence his judgment. And as to the money presents — every office was underpaid; this was the common way of acknowledging pains and trouble: it was analogous to a doctor's or a lawyer's fee now. And there is no proof that either influence ever led Bacon to do wrong. This has been said, and said with some degree of force. But if it shows that Bacon was not in this matter below his age, it shows that he was not above it. No one knew better than Bacon that there were no more certain dangers to honesty and justice than the interference and solicitation of the great, and the old famous pest of bribes, of which all histories and laws were full. And yet on the highest seat of justice in the realm he, the great reformer of its abuses, allowed them to make their customary haunt. He did not mean to do wrong: his conscience was clear; he had not given thought to the mischief they must do, sooner or later, to all concerned

with the Court of Chancery. With a magnificent carelessness he could afford to run safely a course closely bordering on crime, in which meaner men would sin and be ruined.

Before six months were over Bacon found on what terms he must stand with Buckingham. By a strange fatality, quite unintentionally, he became dragged into the thick of the scandalous and grotesque dissensions of the Coke family. The Court was away from London in the North; and Coke had been trying, not without hope of success, to recover the King's favour. Coke was a rich man, and Lady Compton, the mother of the Villiers, thought that Coke's daughter would be a good match for one of her younger sons. It was really a great chance for Coke; but he haggled about the portion; and the opportunity, which might perhaps have led to his taking Bacon's place, passed. But he found himself in trouble in other ways; his friends, especially Secretary Winwood, contrived to bring the matter on again, and he consented to the Villiers's terms. But his wife, the young lady's mother, Lady Hatton, would not hear of it, and a furious quarrel followed. She carried off her daughter into the country. Coke, with a warrant from Secretary Winwood, which Bacon had refused to give him, pursued her: "with his son, 'Fighting Clem,' and ten or eleven servants, weaponed, in a violent manner he repaired to the house where she was remaining, and with a piece of timber or form broke open the door and dragged her along to his coach." Lady Hatton rushed off the same afternoon for help to Bacon.

After an overturn by the way, "at last to my Lord Keeper's they come, but could not have instant access to him, for that his people told them he was laid at rest, being not well. Then my La. Hatton desired she might be in the next room where my Lord lay, that she might be the first that [should] speak with him after he was stirring. The door-keeper fulfilled her desire, and in the meantime gave her a chair to rest herself in, and there left her alone; but not long after, she rose up and bounced against my Lord Keeper's door, and waked him and affrighted him, that he called his men to him; and they opening the door, she thrust in with them, and desired his Lp. to pardon her boldness, but she was like a cow that had lost her calf, and so justified [herself] and pacified my Lord's anger, and got his

warrant and my Lo. Treasurer's warrant and others of the Council to fetch her daughter from the father and bring them both to the Council."

It was a chance that the late Chief-Justice and his wife, with their armed parties, did not meet on the road, in which case "there were like to be strange tragedies." At length the Council compelled both sides to keep the peace, and the young lady was taken for the present out of the hands of her raging parents. Bacon had assumed that the affair was the result of an intrigue between Winwood and Coke, and that the Court would take part against Coke, a man so deep in disgrace and so outrageously violent. Supposing that he had the ear of Buckingham, he wrote earnestly, persuading him to put an end to the business; and in the meantime the Council ordered Coke to be brought before the Star Chamber "for riot and force," to "be heard and sentenced as justice shall appertain." They had not the slightest doubt that they were doing what would please the King. A few days after they met, and then they learned the truth.

"Coke and his friends," writes Chamberlain, "complain of hard measure from some of the greatest at that board, and that he was too much trampled upon with ill language. And our friend [*i.e.* Winwood] passed out scot free for the warrant, which the greatest [*word illegible*] there said was subject to a *præmunire*; and withal told the Lady Compton that they wished well to her and her sons, and would be ready to serve the Earl of Buckingham with all true affection, whereas others did it out of faction and ambition — which words glancing directly at our good friend (Winwood), he was driven to make his apology, and to show how it was put upon him from time to time by the Queen and other parties; and, for conclusion, showed a letter of approbation of all his courses from the King, making the whole table judge what faction and ambition appeared in this carriage. *Ad quod non fuit responsum.*"

None indeed, but blank faces, and thoughts of what might come next. The Council, and Bacon foremost, had made a desperate mistake. "It is evident," as Mr. Spedding says, "that he had not divined Buckingham's feelings on the subject." He was now to learn them. To his utter amazement and alarm he found that the King was strong for the match, and that the proceeding of the Council

was condemned at Court as gross misconduct. In vain he protested that he was quite willing to forward the match; that in fact he had helped it. Bacon's explanations, and his warnings against Coke the King "rejected with some disdain;" he justified Coke's action; he charged Bacon with disrespect and ingratitude to Buckingham; he put aside his arguments and apologies as worthless or insincere. Such reprimands had not often been addressed, even to inferior servants. Bacon's letters to Buckingham remained at first without notice; when Buckingham answered he did so with scornful and menacing curtness. Meanwhile Bacon heard from Yelverton how things were going at Court.

"Sir E. Coke," he wrote, "hath not forborne by any engine to heave at both your Honour and myself, and he works the weightiest instrument, the Earl of Buckingham, who, as I see, sets him as close to him as his shirt, the Earl speaking in Sir Edward's phrase, and as it were menacing in his spirit."

Buckingham, he went on to say, "did nobly and plainly tell me he would not secretly bite, but whosoever had had any interest, or tasted of the opposition to his brother's marriage, he would as openly oppose them to their faces, and they should discern what favour he had by the power he would use." The Court, like a pack of dogs, had set upon Bacon. "It is too common in every man's mouth in Court that your greatness shall be abated, and as your tongue hath been as a razor unto some, so shall theirs be to you." Buckingham said to every one that Bacon had been forgetful of his kindness and unfaithful to him: "not forbearing in open speech to tax you, as if it were an inveterate custom with you, to be unfaithful unto him, as you were to the Earls of Essex and Somerset."

All this while Bacon had been clearly in the right. He had thrust himself into no business that did not concern him. He had not, as Buckingham accuses him of having done, "overtroubled" himself with the marriage. He had done his simple duty as a friend, as a councillor, as a judge. He had been honestly zealous for the Villiers's honour, and warned Buckingham of things that were beyond question. He had curbed Coke's scandalous violence, perhaps with no great regret, but with manifest reason. But for this he was now on the very edge of losing his office; it was clear to him, as it is clear to us, that nothing could save him but

absolute submission. He accepted the condition. How this submission was made and received, and with what gratitude he found that he was forgiven, may be seen in the two following letters. Buckingham thus extends his grace to the Lord Keeper, and exhorts him to better behaviour:

"But his Majesty's direction in answer of your letter hath given me occasion to join hereunto a discovery unto you of mine inward thoughts, proceeding upon the discourse you had with me this day. For I do freely confess that your offer of submission unto me, and in writing (if so I would have it), battered so the unkindness that I had conceived in my heart for your behaviour towards me in my absence, as out of the sparks of my old affection towards you I went to sound his Majesty's intention how he means to behave himself towards you, specially in any public meeting; where I found on the one part his Majesty so little satisfied with your late answer unto him, which he counted (for I protest I use his own terms) *confused and childish*, and his vigorous resolution on the other part so fixed, that he would put some public exemplary mark upon you, as I protest the sight of his deep-conceived indignation quenched my passion, making me upon the instant change from the person of a party into a peace-maker; so as I was forced upon my knees to beg of his Majesty that he would put no public act of disgrace upon you, and, as I dare say, no other person would have been patiently heard in this suit by his Majesty but myself, so did I (though not without difficulty) obtain thus much — that he would not so far disable you from the merit of your future service as to put any particular mark of disgrace upon your person. Only thus far his Majesty protesteth, that upon the conscience of his office he cannot omit (though laying aside all passion) to give a kingly reprimand at his first sitting in council to so many of his councillors as were then here behind, and were actors in this business, for their ill behaviour in it. Some of the particular errors committed in this business he will name, but without accusing any particular persons by name.

"Thus your Lordship seeth the fruits of my natural inclination; and I protest all this time past it was no small grief unto me to hear the mouth of so many upon this occasion open to load you with innumerable malicious and detracting

speeches, as if no music were more pleasing to my ears than to rail of you, which made me rather regret the ill nature of mankind, that like dogs love to set upon him that they see once snatched at. And to conclude, my Lord, you have hereby a fair occasion so to make good hereafter your reputation by your sincere service to his Majesty, as also by your firm and constant kindness to your friends, as I may (your Lordship's old friend) participate of the comfort and honour that will thereby come to you. Thus I rest at last

"Your Lordship's faithful friend and servant,
"G.B."

"MY EVER BEST LORD, now better than yourself, — Your Lordship's pen, or rather pencil, hath pourtrayed towards me such magnanimity and nobleness and true kindness, as methinketh I see the image of some ancient virtue, and not anything of these times. It is the line of my life, and not the lines of my letter, that must express my thankfulness; wherein if I fail, then God fail me, and make me as miserable as I think myself at this time happy by this reviver, through his Majesty's singular clemency, and your incomparable love and favour. God preserve you, prosper you, and reward you for your kindness to

"Your raised and infinitely obliged friend and servant,
"Sept. 22, 1617.
FR. BACON, C.S."

Thus he had tried his strength with Buckingham. He had found that this, "a little parent-like" manner of advising him, and the doctrine that a true friend "ought rather to go against his mind than his good," was not what Buckingham expected from him. And he never ventured on it again. It is not too much to say that a man who could write as he now did to Buckingham, could not trust himself in any matter in which Buckingham, was interested.

But the reconciliation was complete, and Bacon took his place more and more as one of the chief persons in the Government. James claimed so much to have

his own way, and had so little scruple in putting aside, in his superior wisdom, sometimes very curtly, Bacon's or any other person's recommendations, that though his services were great, and were not unrecognised, he never had the power and influence in affairs to which his boundless devotion to the Crown, his grasp of business, and his willing industry, ought to have entitled him. He was still a servant, and made to feel it, though a servant in the "first form." It was James and Buckingham who determined the policy of the country, or settled the course to be taken in particular transactions; when this was settled, it was Bacon's business to carry it through successfully. In this he was like all the other servants of the Crown, and like them he was satisfied with giving his advice, whether it were taken or not; but unlike many of them he was zealous in executing with the utmost vigour and skill the instructions which were given him. Thus he was required to find the legal means for punishing Raleigh; and, as a matter of duty, he found them. He was required to tell the Government side of the story of Raleigh's crimes and punishment — which really was one side of the story, only not by any means the whole; and he told it, as he had told the Government story against Essex, with force, moderation, and good sense. Himself, he never would have made James's miserable blunders about Raleigh; but the blunders being made, it was his business to do his best to help the King out of them. When Suffolk, the Lord Treasurer, was disgraced and brought before the Star Chamber for corruption and embezzlement in his office, Bacon thought that he was doing no more than his duty in keeping Buckingham informed day by day how the trial was going on; how he had taken care that Suffolk's submission should not stop it— "for all would be but a play on the stage if justice went not on in the right course;" how he had taken care that the evidence went well— "I will not say I sometime holp it, as far as was fit for a judge;" how, "a little to warm the business" ... "I spake a word, that he that did draw or milk treasure from Ireland, did not, *emulgere*, milk money, but blood." This, and other "little things" like it, while he was sitting as a judge to try, if the word may be used, a personal enemy of Buckingham, however bad the case might be against Suffolk, sound strange indeed to us; and not less so when, in

reporting the sentence and the various opinions of the Council about it, he, for once, praises Coke for the extravagance of his severity: “Sir Edward Coke did his part — I have not heard him do better — and began with a fine of £100,000; but the judges first, and most of the rest, reduced it to £30,000. I do not dislike that thing passed moderately; and all things considered, it is not amiss, and might easily have been worse.”

In all this, which would have been perfectly natural from an Attorney-General of the time, Bacon saw but his duty, even as a judge between the Crown and the subject. It was what was expected of those whom the King chose to employ, and whom Buckingham chose to favour. But a worse and more cruel case, illustrating the system which a man like Bacon could think reasonable and honourable, was the disgrace and punishment of Yelverton, the Attorney-General, the man who had stood by Bacon, and in his defence had faced Buckingham, knowing well Buckingham’s dislike of himself, when all the Court turned against Bacon in his quarrel with Coke and Lady Compton. Towards the end of the year 1620, on the eve of a probable meeting of Parliament, there was great questioning about what was to be done about certain patents and monopolies — monopolies for making gold and silk thread, and for licensing inns and ale-houses — which were in the hands of Buckingham’s brothers and their agents. The monopolies were very unpopular; there was always doubt as to their legality; they were enforced oppressively and vexatiously by men like Michell and Mompesson, who acted for the Villiers; and the profits of them went, for the most part, not into the Exchequer, but into the pockets of the hangers-on of Buckingham. Bacon defended them both in law and policy, and his defence is thought by Mr. Gardiner to be not without grounds; but he saw the danger of obstinacy in maintaining what had become so hateful in the country, and strongly recommended that the more indefensible and unpopular patents should be spontaneously given up, the more so as they were of “no great fruit.” But Buckingham’s insolent perversity “refused to be convinced.” The Council, when the question was before them, decided to maintain them. Bacon, who had rightly voted in the minority, thus explains his own vote to Buckingham: “The

King did wisely put it upon and consult, whether the patents were at this time to be removed by Act of Council before Parliament. *I opined (but yet somewhat like Ovid's mistress, that strove, but yet as one that would be overcome), that yes!*" But in the various disputes which had arisen about them, Yelverton had shown that he very much disliked the business of defending monopolies, and sending London citizens to jail for infringing them. He did it, but he did it grudgingly. It was a great offence in a man whom Buckingham had always disliked; and it is impossible to doubt that what followed was the consequence of his displeasure.

"In drawing up a new charter for the city of London," writes Mr. Gardiner, "Yelverton inserted clauses for which he was unable to produce a warrant. The worst that could be said was that he had, through inadvertence, misunderstood the verbal directions of the King. Although no imputation of corruption was brought against him, yet he was suspended from his office, and prosecuted in the Star Chamber. He was then sentenced to dismissal from his post, to a fine of £4000, and to imprisonment during the Royal pleasure."

In the management of this business Bacon had the chief part. Yelverton, on his suspension, at once submitted. The obnoxious clauses are not said to have been of serious importance, but they were new clauses which the King had not sanctioned, and it would be a bad precedent to pass over such unauthorised additions even by an Attorney-General. "I mistook many things," said Yelverton afterwards, in words which come back into our minds at a later period, "I was improvident in some things, and too credulous in all things." It might have seemed that dismissal, if not a severe reprimand, was punishment enough. But the submission was not enough, in Bacon's opinion, "for the King's honour." He dwelt on the greatness of the offence, and the necessity of making a severe example. According to his advice, Yelverton was prosecuted in the Star Chamber. It was not merely a mistake of judgment. "Herein," said Bacon, "I note the wisdom of the law of England, which termeth the highest contempt and excesses of authority *Misprisions*; which (if you take the sound and derivation of the word) is but *mistaken*; but if you take the use and acception of the word, it is

high and heinous contempt and usurpation of authority; whereof the reason I take to be and the name excellently imposed, for that main mistaking, it is ever joined with contempt; for he that reveres will not easily mistake; but he that slights, and thinks more of the greatness of his place than of the duty of his place, will soon commit misprisions." The day would come when this doctrine would be pressed with ruinous effect against Bacon himself. But now he expounded with admirable clearness the wrongness of carelessness about warrants and of taking things for granted. He acquitted his former colleague of "corruption of reward;" but "in truth that makes the offence rather divers than less;" for some offences "are black, and others scarlet, some sordid, some presumptuous." He pronounced his sentence — the fine, the imprisonment; "for his place, I declare him unfit for it." "And the next day," says Mr. Spedding, "he reported to Buckingham the result of the proceeding," and takes no small credit for his own part in it.

It was thus that the Court used Bacon, and that Bacon submitted to be used. He could have done, if he had been listened to, much nobler service. He had from the first seen, and urged as far as he could, the paramount necessity of retrenchment in the King's profligate expenditure. Even Buckingham had come to feel the necessity of it at last; and now that Bacon filled a seat at the Council, and that the prosecution of Suffolk and an inquiry into the abuses of the Navy had forced on those in power the urgency of economy, there was a chance of something being done to bring order into the confusion of the finances. Retrenchment began at the King's kitchen and the tables of his servants; an effort was made, not unsuccessfully, to extend it wider, under the direction of Lionel Cranfield, a self-made man of business from the city; but with such a Court the task was an impossible one. It was not Bacon's fault, though he sadly mismanaged his own private affairs, that the King's expenditure was not managed soberly and wisely. Nor was it Bacon's fault, as far as advice went, that James was always trying either to evade or to outwit a Parliament which he could not, like the Tudors, overawe. Bacon's uniform counsel had been — Look on a Parliament as a certain necessity, but not only as a necessity, as also a

unique and most precious means for uniting the Crown with the nation, and proving to the world outside how Englishmen love and honour their King, and their King trusts his subjects. Deal with it frankly and nobly as becomes a king, not suspiciously like a huckster in a bargain. Do not be afraid of Parliament. Be skilful in calling it, but don't attempt to "pack" it. Use all due adroitness and knowledge of human nature, and necessary firmness and majesty, in managing it; keep unruly and mischievous people in their place, but do not be too anxious to meddle— "let nature work;" and above all, though of course you want money from it, do not let that appear as the chief or real cause of calling it. Take the lead in legislation. Be ready with some interesting or imposing points of reform, or policy, about which you ask your Parliament to take counsel with you. Take care to "frame and have ready some commonwealth bills, that may add respect to the King's government and acknowledgment of his care; not *wooing* bills to make the King and his graces cheap, but good matter to set the Parliament on work, that an empty stomach do not feed on humour." So from the first had Bacon always thought; so he thought when he watched, as a spectator, James's blunders with his first Parliament of 1604; so had he earnestly counselled James, when admitted to his confidence, as to the Parliaments of 1614 and 1615; so again, but in vain, as Chancellor, he advised him to meet the Parliament of 1620. It was wise, and from his point of view honest advice, though there runs all through it too much reliance on appearances which were not all that they seemed; there was too much thought of throwing dust in the eyes of troublesome and inconvenient people. But whatever motives there might have been behind, it would have been well if James had learned from Bacon how to deal with Englishmen. But he could not. "I wonder," said James one day to Gondomar, "that my ancestors should ever have permitted such an institution as the House of Commons to have come into existence. I am a stranger, and found it here when I arrived, so that I am obliged to put up with what I cannot get rid of." James was the only one of our many foreign kings who, to the last, struggled to avoid submitting himself to the conditions of an English throne.

CHAPTER VI.

BACON'S FALL.

When Parliament met on January 30, 1620/21, and Bacon, as Lord Chancellor, set forth in his ceremonial speeches to the King and to the Speaker the glories and blessings of James's reign, no man in England had more reason to think himself fortunate. He had reached the age of sixty, and had gained the object of his ambition. More than that, he was conscious that in his great office he was finding full play for his powers and his high public purposes. He had won greatly on the confidence of the King. He had just received a fresh mark of honour from him: a few days before he had been raised a step in the peerage, and he was now Viscount St. Alban's. With Buckingham he seemed to be on terms of the most affectionate familiarity, exchanging opinions freely with him on every subject. And Parliament met in good-humour. They voted money at once. One of the matters which interested Bacon most — the revision of the Statute Book — they took up as one of their first measures, and appointed a Select Committee to report upon it. And what, amid the apparent felicity of the time, was of even greater personal happiness to Bacon, the first step of the "Great Instauration" had been taken. During the previous autumn, Oct. 12, 1620, the *Novum Organum*, the first instalment of his vast design, was published, the result of the work of thirty years; and copies were distributed to great people, among others to Coke. He apprehended no evil; he had nothing to fear, and much to hope from the times.

His sudden and unexpected fall, so astonishing and so irreparably complete, is one of the strangest events of that still imperfectly comprehended time. There had been, and were still to be, plenty of instances of the downfall of power, as ruinous and even more tragic, though scarcely any one more pathetic in its surprise and its shame. But it is hard to find one of which so little warning was given, and the causes of which are at once in part so clear, and in part so obscure

and unintelligible. Such disasters had to be reckoned upon as possible chances by any one who ventured into public life. Montaigne advises that the discipline of pain should be part of every boy's education, for the reason that every one in his day might be called upon to undergo the torture. And so every public man, in the England of the Tudors and Stuarts, entered on his career with the perfectly familiar expectation of possibly closing it — it might be in an honourable and ceremonious fashion, in the Tower and on the scaffold — just as he had to look forward to the possibility of closing it by small-pox or the plague. So that when disaster came, though it might be unexpected, as death is unexpected, it was a turn of things which ought not to take a man by surprise. But some premonitory signs usually gave warning. There was nothing to warn Bacon that the work which he believed he was doing so well would be interrupted.

We look in vain for any threatenings of the storm. What the men of his time thought and felt about Bacon it is not easy to ascertain. Appearances are faint and contradictory; he himself, though scornful of judges who sought to be "popular," believed that he "came in with the favour of the general;" that he "had a little popular reputation, which followeth me whether I will or no." No one for years had discharged the duties of his office with greater efficiency. Scarcely a trace remains of any suspicion, previous to the attack upon him, of the justice of his decisions; no instance was alleged that, in fact, impure motives had controlled the strength and lucidity of an intellect which loved to be true and right for the mere pleasure of being so. Nor was there anything in Bacon's political position to make him specially obnoxious above all others of the King's Council. He maintained the highest doctrines of prerogative; but they were current doctrines, both at the Council board and on the bench; and they were not discredited nor extinguished by his fall. To be on good terms with James and Buckingham meant a degree of subservience which shocks us now; but it did not shock people then, and he did not differ from his fellows in regarding it as part of his duty as a public servant of the Crown. No doubt he had enemies — some with old grudges like Southampton, who had been condemned with Essex; some like Suffolk, smarting under recent reprimands and the biting edge of Bacon's

tongue; some like Coke, hating him from constitutional antipathies and the strong antagonism of professional doctrines, for a long course of rivalry and for mortifying defeats. But there is no appearance of preconcerted efforts among them to bring about his overthrow. He did not at the time seem to be identified with anything dangerous or odious. There was no doubt a good deal of dissatisfaction with Chancery — among the common lawyers, because it interfered with their business; in the public, partly from the traditions of its slowness, partly from its expensiveness, partly because, being intended for special redress of legal hardship, it was sure to disappoint one party to a suit. But Bacon thought that he had reformed Chancery. He had also done a great deal to bring some kind of order, or at least hopefulness of order, into the King's desperate finances. And he had never set himself against Parliament. On the contrary, he had always been forward to declare that the King could not do without Parliament, and that Parliament only needed to be dealt with generously, and as "became a King," to be not a danger and hindrance to the Crown but its most sincere and trustworthy support.

What was then to portend danger to Bacon when the Parliament of 1620/21 met? The House of Commons at its meeting was thoroughly loyal and respectful; it meant to be *benedictum et pacificum parliamentum*. Every one knew that there would be "grievances" which would not be welcome to the Court, but they did not seem likely to touch him. Every one knew that there would be questions raised about unpopular patents and oppressive monopolies, and about their legality; and it was pretty well agreed upon at Court that they should be given up as soon as complained of. But Bacon was not implicated more than the Crown lawyers before him, in what all the Crown lawyers had always defended. There was dissatisfaction about the King's extravagance and wastefulness, about his indecision in the cause of the Elector Palatine, about his supposed intrigues with Papistical and tyrannical Spain; but Bacon had nothing to do with all this except, as far as he could, to give wise counsel and warning. The person who made the King despised and hated was the splendid and insolent favourite, Buckingham. It might have been thought that the one thing to be set against much that was

wrong in the State was the just and enlightened and speedy administration of equity in the Chancery.

When Parliament met, though nothing seemed to threaten mischief, it met with a sturdy purpose of bringing to account certain delinquents whose arrogance and vexations of the subjects had provoked the country, and who were supposed to shelter themselves under the countenance of Buckingham. Michell and Mompesson were rascals whose misdemeanors might well try the patience of a less spirited body than an English House of Commons. Buckingham could not protect them, and hardly tried to do so. But just as one electric current "induces" another by neighbourhood, so all this deep indignation against Buckingham's creatures created a fierce temper of suspicion about corruption all through the public service. Two Committees were early appointed by the House of Commons: one a Committee on Grievances, such as the monopolies; the other, a Committee to inquire into abuses in the Courts of Justice and receive petitions about them. In the course of the proceedings, the question arose in the House as to the authorities or "referees" who had certified to the legality of the Crown patents or grants which had been so grossly abused; and among these "referees" were the Lord Chancellor and other high officers, both legal and political.

It was the little cloud. But lookers-on like Chamberlain did not think much of it. "The referees," he wrote on Feb. 29th, "who certified the legality of the patents are glanced at, but they are chiefly above the reach of the House; they attempt so much that they will accomplish little." Coke, who was now the chief leader in Parliament, began to talk ominously of precedents, and to lay down rules about the power of the House to punish — rules which were afterwards found to have no authority for them. Cranfield, the representative of severe economy, insisted that the honour of the King required that the referees, whoever they were, should be called to account. The gathering clouds shifted a little, when the sense of the House seemed to incline to giving up all retrospective action, and to a limitation for the future by statute of the questionable prerogative — a limitation which was in fact attempted by a bill thrown out by

the Lords. But they gathered again when the Commons determined to bring the whole matter before the House of Lords. The King wrote to warn Bacon of what was coming. The proposed conference was staved off by management for a day or two, but it could not be averted, and the Lords showed their eagerness for it. And two things by this time — the beginning of March — seemed now to have become clear, first, that under the general attack on the referees was intended a blow against Bacon; next, that the person whom he had most reason to fear was Sir Edward Coke.

The storm was growing; but Bacon was still unalarmed, though Buckingham had been frightened into throwing the blame on the referees.

"I do hear," he writes to Buckingham (dating his letter on March 7th, "the day I received the seal"), "from divers of judgement, that to-morrow's conference is like to pass in a calm, as to the referees. Sir Lionel Cranfield, who hath been formerly the trumpet, said yesterday that he did now incline unto Sir John Walter's opinion and motion not to have the referees meddled with, otherwise than to discount it from the King; and so not to look back, but to the future. And I do hear almost all men of judgement in the House wish now that way. I woo nobody; I do but listen, and I have doubt only of Sir Edward Coke, who I wish had some round *caveat* given him from the King; for your Lordship hath no great power with him. But a word from the King mates him."

But Coke's opportunity had come. The House of Commons was disposed for gentler measures. But he was able to make it listen to his harsher counsels, and from this time his hand appears in all that was done. The first conference was a tame and dull one. The spokesmen had been slack in their disagreeable and perhaps dangerous duty. But Coke and his friends took them sharply to task. "The heart and tongue of Sir Edward Coke are true relations," said one of his fervent supporters; "but his pains hath not reaped that harvest of praise that he hath deserved. For the referees, they are as transcendent delinquents as any other, and sure their souls made a wilful elopement from their bodies when they made these certificates." A second conference was held with the Lords, and this time the charge was driven home. The referees were named, the Chancellor at

the head of them. When Bacon rose to explain and justify his acts he was sharply stopped, and reminded that he was transgressing the orders of the House in speaking till the Committees were named to examine the matter. What was even more important, the King had come to the House of Lords (March 10th), and frightened, perhaps, about his subsidies, told them "that he was not guilty of those grievances which are now discovered, but that he grounded his judgement upon others who have misled him." The referees would be attacked, people thought, if the Lower House had courage.

All this was serious. As things were drifting, it seemed as if Bacon might have to fight the legal question of the prerogative in the form of a criminal charge, and be called upon to answer the accusation of being the minister of a crown which legal language pronounced absolute, and of a King who interpreted legal language to the letter; and further, to meet his accusers after the King himself had disavowed what his servant had done. What passed between Bacon and the King is confused and uncertain; but after his speech the King could scarcely have thought of interfering with the inquiry. The proceedings went on; Committees were named for the several points of inquiry; and Bacon took part in these arrangements. It was a dangerous position to have to defend himself against an angry House of Commons, led and animated by Coke and Cranfield. But though the storm had rapidly thickened, the charges against the referees were not against him alone. His mistake in law, if it was a mistake, was shared by some of the first lawyers and first councillors in England. There was a battle before him, but not a hopeless one. "*Modicæ fidei, quare dubitasti*" he writes about this time to an anxious friend.

But in truth the thickening storm had been gathering over his head alone. It was against him that the whole attack was directed; as soon as it took a different shape, the complaints against the other referees, such as the Chief-Justice, who was now Lord Treasurer, though some attempt was made to press them, were quietly dropped. What was the secret history of these weeks we do not know. But the result of Bacon's ruin was that Buckingham was saved. "As they speak of the Turquoise stone in a ring," Bacon had said to Buckingham when he was

made Chancellor, “I will break into twenty pieces before you have the least fall.” Without knowing what he pledged himself to, he was taken at his word.

At length the lightning fell. During the early part of March, while these dangerous questions were mooted about the referees, a Committee, appointed early in the session, had also been sitting on abuses in courts of justice, and as part of their business, an inquiry had been going on into the ways of the subordinate officers of the Court of Chancery. Bacon had early (Feb. 17th) sent a message to the Committee courting full inquiry, “willingly consenting that any man might speak anything of his Court.” On the 12th of March the chairman, Sir R. Philips, reported that he had in his hands “divers petitions, many frivolous and clamorous, many of weight and consequence.” Cranfield, who presided over the Court of Wards, had quarrelled fiercely with the Chancery, where he said there was “neither Law, Equity, nor Conscience,” and pressed the inquiry, partly, it may be, to screen his own Court, which was found fault with by the lawyers. Some scandalous abuses were brought to light in the Chancery. They showed that “Bacon was at fault in the art of government,” and did not know how to keep his servants in order. One of them, John Churchill, an infamous forger of Chancery orders, finding things going hard with him, and “resolved,” it is said, “not to sink alone,” offered his confessions of all that was going on wrong in the Court. But on the 15th of March things took another turn. It was no longer a matter of doubtful constitutional law; no longer a question of slack discipline over his officers. To the astonishment, if not of the men of his own day, at least to the unexhausted astonishment of times following, a charge was suddenly reported from the Committee to the Commons against the Lord Chancellor, not of straining the prerogative, or of conniving at his servants’ misdoings, but of being himself a corrupt and venal judge. Two suitors charged him with receiving bribes. Bacon was beginning to feel worried and anxious, and he wrote thus to Buckingham. At length he had begun to see the meaning of all these inquiries, and to what they were driving.

“MY VERY GOOD LORD, — Your Lordship spake of Purgatory. I am now in it, but my mind is in a calm, for my fortune is not my felicity. I know I have

clean hands and a clean heart, and I hope a clean house for friends or servants. But Job himself, or whosoever was the justest judge, by such hunting for matters against him as hath been used against me, may for a time seem foul, specially in a time when greatness is the mark and accusation is the game. And if this be to be a Chancellor. I think if the great seal lay upon Hounslow Heath nobody would take it up. But the King and your Lordship will, I hope, put an end to these miseries one way or other. And in troth that which I fear most is lest continual attendance and business, together with these cares, and want of time to do my weak body right this spring by diet and physic, will cast me down; and then it will be thought feigning or fainting. But I hope in God I shall hold out. God prosper you."

The first charges attracted others, which were made formal matters of complaint by the House of Commons. John Churchill, to save himself, was busy setting down cases of misdoing; and probably suitors of themselves became ready to volunteer evidence. But of this Bacon as yet knew nothing. He was at this time only aware that there were persons who were "hunting out complaints against him," that the attack was changed from his law to his private character; he had found an unfavourable feeling in the House of Lords; and he knew well enough what it was to have powerful enemies in those days when a sentence was often settled before a trial. To any one, such a state of things was as formidable as the first serious symptoms of a fever. He was uneasy, as a man might well be on whom the House of Commons had fixed its eye, and to whom the House of Lords had shown itself unfriendly. But he was as yet conscious of nothing fatal to his defence, and he knew that if false accusations could be lightly made they could also be exposed.

A few days after the first mention of corruption the Commons laid their complaints of him before the House of Lords, and on the same day (March 19) Bacon, finding himself too ill to go to the House, wrote to the Peers by Buckingham, requesting them that as some "complaints of base bribery" had come before them, they would give him a fair opportunity of defending himself, and of cross-examining witnesses; especially begging, that considering the

number of decrees which he had to make in a year — more than two thousand — and "the courses which had been taken in hunting out complaints against him," they would not let their opinion of him be affected by the mere number of charges that might be made. Their short verbal answer, moved by Southampton (March 20), that they meant to proceed by right rule of justice, and would be glad if he cleared his honour, was not encouraging. And now that the Commons had brought the matter before them, the Lords took it entirely into their own hands, appointing three Committees, and examining the witnesses themselves. New witnesses came forward every day with fresh cases of gifts and presents, "bribes" received by the Lord Chancellor. When Parliament rose for the Easter vacation (March 27-April 17), the Committees continued sitting. A good deal probably passed of which no record remains. When the Commons met again (April 17) Coke was full of gibes about *Instauratio Magna* — the true *Instauratio* was to restore laws — and two days after an Act was brought in for review and reversal of decrees in Courts of Equity. It was now clear that the case against Bacon had assumed formidable dimensions, and also a very strange, and almost monstrous shape. For the Lords, who were to be the judges, had by their Committees taken the matter out of the hands of the Commons, the original accusers, and had become themselves the prosecutors, collecting and arranging evidence, accepting or rejecting depositions, and doing all that counsel or the committing magistrate would do preliminary to a trial. There appears to have been no cross-examining of witnesses on Bacon's behalf, or hearing witnesses for him — not unnaturally at this stage of business, when the prosecutors were engaged in making out their own case; but considering that the future judges had of their own accord turned themselves into the prosecutors, the unfairness was great. At the same time it does not appear that Bacon did anything to watch how things went in the Committees, which had his friends in them as well as his enemies, and are said to have been open courts. Towards the end of March, Chamberlain wrote to Carleton that "the Houses were working hard at cleansing out the Augæan stable of monopolies, and also extortions in Courts of Justice. The petitions against the Lord Chancellor were too numerous to be got through:

his chief friends and brokers of bargains, Sir George Hastings and Sir Richard Young, and others attacked, are obliged to accuse him in their own defence, though very reluctantly. His ordinary bribes were £300, £400, and even £1000.... The Lords admit no evidence except on oath. One Churchill, who was dismissed from the Chancery Court for extortion, is the chief cause of the Chancellor's ruin."[3] Bacon was greatly alarmed. He wrote to Buckingham, who was "his anchor in these floods." He wrote to the King; he was at a loss to account for the "tempest that had come on him;" he could not understand what he had done to offend the country or Parliament; he had never "taken rewards to pervert justice, however he might be frail, and partake of the abuse of the time."

"Time hath been when I have brought unto you *genitum columbæ*, from others. Now I bring it from myself. I fly unto your Majesty with the wings of a dove, which once within these seven days I thought would have carried me a higher flight.

"When I enter into myself, I find not the materials of such a tempest as is comen upon me. I have been (as your Majesty knoweth best) never author of any immoderate counsel, but always desired to have things carried *suavibus modis*. I have been no avaricious oppressor of the people. I have been no haughty or intolerable or hateful man, in my conversation or carriage. I have inherited no hatred from my father, but am a good patriot born. Whence should this be? For these are the things that use to raise dislikes abroad."

And he ended by entreating the King to help him:

"That which I thirst after, as the hart after the streams, is that I may know by my matchless friend [Buckingham] that presenteth to you this letter, your Majesty's heart (which is an *abyssus* of goodness, as I am an *abyssus* of misery) towards me. I have been ever your man, and counted myself but an usufructuary of myself, the property being yours; and now making myself an oblation to do with me as may best conduce to the honour of your justice, the honour of your mercy, and the use of your service, resting as

"Clay in your Majesty's gracious hands

"Fr. St. Aldan, Canc.
"March 25, 1621."

To the world he kept up an undismayed countenance: he went down to Gorhambury, attended by troops of friends. "This man," said Prince Charles, when he met his company, "scorns to go out like a snuff." But at Gorhambury he made his will, leaving "his name to the next ages and to foreign nations;" and he wrote a prayer, which is a touching evidence of his state of mind —

"Most gracious Lord God, my merciful Father, from my youth up, my Creator, my Redeemer, my Comforter. Thou (O Lord) soundest and searchest the depths and secrets of all hearts; thou knowledgest the upright of heart, thou judgest the hypocrite, thou ponderest men's thoughts and doings as in a balance, thou measurest their intentions as with a line, vanity and crooked ways cannot be hid from thee.

"Remember (O Lord) how thy servant hath walked before thee; remember what I have first sought, and what hath been principal in mine intentions. I have loved thy assemblies, I have mourned for the divisions of thy Church, I have delighted in the brightness of thy sanctuary. This vine which thy right hand hath planted in this nation, I have ever prayed unto thee that it might have the first and the latter rain; and that it might stretch her branches to the seas and to the floods. The state and bread of the poor and oppressed have been precious in my eyes: I have hated all cruelty and hardness of heart; I have (though in a despised weed) procured the good of all men. If any have been mine enemies, I thought not of them; neither hath the sun almost set upon my displeasure; but I have been as a dove, free from superfluity of maliciousness. Thy creatures have been my books, but thy Scriptures much more. I have sought thee in the courts, fields, and gardens, but I have found thee in thy temples.

"Thousand have been my sins, and ten thousand my transgressions; but thy sanctifications have remained with me, and my heart, through thy grace, hath been an unquenched coal upon thy altar. O Lord, my strength, I have since my youth met with thee in all my ways, by thy fatherly compassions, by thy

comfortable chastisements, and by thy most visible providence. As thy favours have increased upon me, so have thy corrections; so as thou hast been alway near me, O Lord; and ever as my worldly blessings were exalted, so secret darts from thee have pierced me; and when I have ascended before men, I have descended in humiliation before thee.

"And now when I thought most of peace and honour, thy hand is heavy upon me, and hath humbled me, according to thy former loving-kindness, keeping me still in thy fatherly school, not as a bastard, but as a child. Just are thy judgements upon me for my sins, which are more in number than the sands of the sea, but have no proportion to thy mercies; for what are the sands of the sea to the sea, earth, heavens? and all these are nothing to thy mercies.

"Besides my innumerable sins, I confess before thee that I am debtor to thee for the gracious talent of thy gifts and graces, which I have misspent in things for which I was least fit; so as I may truly say, my soul hath been a stranger in the course of my pilgrimage. Be merciful unto me (O Lord) for my Saviour's sake, and receive me into thy bosom, or guide me in thy ways."

Bacon up to this time strangely, if the Committees were "open Courts," was entirely ignorant of the particulars of the charge which was accumulating against him. He had an interview with the King, which was duly reported to the House, and he placed his case before James, distinguishing between the "three cases of bribery supposed in a judge — a corrupt bargain; carelessness in receiving a gift while the cause is going on; and, what is innocent, receiving a gift after it is ended." And he meant in such words as these to place himself at the King's disposal, and ask his direction:

"For my fortune, *summa summarum* with me is, that I may not be made altogether unprofitable to do your Majesty service or honour. If your Majesty continue me as I am, I hope I shall be a new man, and shall reform things out of feeling, more than another can do out of example. If I cast part of my burden, I shall be more strong and *delivré* to bear the rest. And, to tell your Majesty what my thoughts run upon, I think of writing a story of England, and of recompiling of your laws into a better digest."

The King referred him to the House; and the House now (April 19th) prepared to gather up into "one brief" the charges against the Lord Chancellor, still, however, continuing open to receive fresh complaints.

Meanwhile the chase after abuses of all kinds was growing hotter in the Commons — abuses in patents and monopolies, which revived the complaints against referees, among whom Bacon was frequently named, and abuses in the Courts of Justice. The attack passed by and spared the Common Law Courts, as was noticed in the course of the debates; it spared Cranfield's Court, the Court of Wards. But it fell heavily on the Chancery and the Ecclesiastical Courts. "I have neither power nor will to defend Chancery," said Sir John Bennett, the judge of the Prerogative Court; but a few weeks after his turn came, and a series of as ugly charges as could well be preferred against a judge, charges of extortion as well as bribery, were reported to the House by its Committee. There can be no doubt of the grossness of many of these abuses, and the zeal against them was honest, though it would have shown more courage if it had flown at higher game; but the daily discussion of them helped to keep alive and inflame the general feeling against so great a "delinquent" as the Lord Chancellor was supposed to be. And, indeed, two of the worst charges against him were made before the Commons. One was a statement made in the House by Sir George Hastings, a member of the House, who had been the channel of Awbry's gift, that when he had told Bacon that if questioned he must admit it, Bacon's answer was: "George, if you do so, I must deny it upon my honour — upon my oath." The other was that he had given an opinion in favour of some claim of the Masters in Chancery for which he received £1200, and with which he said that all the judges agreed — an assertion which all the judges denied. Of these charges there is no contradiction.[4]

Bacon made one more appeal to the King (April 21). He hoped that, by resigning the seal, he might be spared the sentence:

"But now if not *per omnipotentiam* (as the divines speak), but *per potestatem suaviter disponentem*, your Majesty will graciously save me from a sentence

with the good liking of the House, and that cup may pass from me; it is the utmost of my desires.

"This I move with the more belief, because I assure myself that if it be reformation that is sought, the very taking away the seal, upon my general submission, will be as much in example for these four hundred years as any furder severity."

At length, informally, but for the first time distinctly, the full nature of the accusation, with its overwhelming list of cases, came to Bacon's knowledge (April 20 or 21). From the single charge, made in the middle of March, it had swelled in force and volume like a rising mountain torrent. That all these charges should have sprung out of the ground from their long concealment is strange enough. How is it that nothing was heard of them when the things happened? And what is equally strange is that these charges were substantially true and undeniable; that this great Lord Chancellor, so admirable in his despatch of business, hitherto so little complained of for wrong or unfair decisions, had been in the habit of receiving large sums of money from suitors, in some cases certainly while the suit was pending. And further, while receiving them, while perfectly aware of the evil of receiving gifts on the seat of judgment, while emphatically warning inferior judges against yielding to the temptation, he seems really to have continued unconscious of any wrong-doing while gift after gift was offered and accepted. But nothing is so strange as the way in which Bacon met the charges. Tremendous as the accusation was, he made not the slightest fight about it. Up to this time he had held himself innocent. Now, overwhelmed and stunned, he made no attempt at defence; he threw up the game without a struggle, and volunteered an absolute and unreserved confession of his guilt — that is to say, he declined to stand his trial. Only, he made an earnest application to the House of Lords, in proceeding to sentence, to be content with a general admission of guilt, and to spare him the humiliation of confessing the separate facts of alleged "bribery" which were contained in the twenty-eight Articles of his accusation. This submission, "grounded only on rumour," for the Articles of charge had not yet been communicated to him by the accusers, took

the House by surprise. “No Lord spoke to it, after it had been read, for a long time.” But they did not mean that he should escape with this. The House treated the suggestion with impatient scorn (April 24). “It is too late,” said Lord Saye. “No word of confession of any corruption in the Lord Chancellor’s submission,” said Southampton; “it stands with the justice and honour of this House not to proceed without the parties’ particular confession, or to have the parties to hear the charge, and we to hear the parties answer.” The demand of the Lords was strictly just, but cruel; the Articles were now sent to him; he had been charged with definite offences; he must answer yes or no, confess them or defend himself. A further question arose whether he should not be sent for to appear at the bar. He still held the seals. “Shall the Great Seal come to the bar?” asked Lord Pembroke. It was agreed that he was to be asked whether he would acknowledge the particulars. His answer was “that he will make no manner of defence to the charge, but meaneth to acknowledge corruption, and to make a particular confession to every point, and after that a humble submission. But he humbly craves liberty that, when the charge is more full than he finds the truth of the fact, he may make a declaration of the truth in such particulars, the charge being brief and containing not all the circumstances.” And such a confession he made. “My Lords,” he said, to those who were sent to ask whether he would stand to it, “it is my act, my hand, my heart. I beseech your Lordships be merciful to a broken reed.” This was, of course, followed by a request to the King from the House to “sequester” the Great Seal. A commission was sent to receive it (May 1). “The worse, the better,” he answered to the wish, “that it had been better with him.” “By the King’s great favour I received the Great Seal; by my own great fault I have lost it.” They intended him now to come to the bar to receive his sentence. But he was too ill to leave his bed. They did not push this point farther, but proceeded to settle the sentence (May 3). He had asked for mercy, but he did not get it. There were men who talked of every extremity short of death. Coke, indeed, in the Commons, from his store of precedents, had cited cases where judges had been hanged for bribery. But the Lords would not hear of this. “His offences foul,” said Lord Arundel; “his confession pitiful. Life not

to be touched." But Southampton, whom twenty years before he had helped to involve in Essex's ruin, urged that he should be degraded from the peerage; and asked whether, at any rate, "he whom this House thinks unfit to be a constable shall come to the Parliament." He was fined £40,000. He was to be imprisoned in the Tower during the King's pleasure. He was to be incapable of any office, place, or employment in the State or Commonwealth. He was never to sit in Parliament or come within the verge of the Court. This was agreed to, Buckingham only dissenting. "The Lord Chancellor is so sick," he said, "that he cannot live long."

What is the history of this tremendous catastrophe by which, in less than two months, Bacon was cast down from the height of fortune to become a byword of shame? He had enemies, who certainly were glad, but there is no appearance that it was the result of any plot or combination against him. He was involved, accidentally, it may almost be said, in the burst of anger excited by the intolerable dealings of others. The indignation provoked by Michell and Mompesson and their associates at that particular moment found Bacon in its path, doing, as it seemed, in his great seat of justice, even worse than they; and when he threw up all attempt at defence, and his judges had his hand to an unreserved confession of corruption, both generally, and in the long list of cases alleged against him, it is not wonderful that they came to the conclusion, as the rest of the world did, that he was as bad as the accusation painted him — a dishonest and corrupt judge. Yet it is strange that they should not have observed that not a single charge of a definitely unjust decision was brought, at any rate was proved, against him. He had taken money, they argued, and therefore he must be corrupt; but if he had taken money to pervert judgment, some instance of the iniquity would certainly have been brought forward and proved. There is no such instance to be found; though, of course, there were plenty of dissatisfied suitors; of course the men who had paid their money and lost their cause were furious. But in vain do we look for any case of proved injustice. The utmost that can be said is that in some cases he showed favour in pushing forward and expediting suits. So that the real charge against Bacon assumes, to us who have

not to deal practically with dangerous abuses, but to judge conduct and character, a different complexion. Instead of being the wickedness of perverting justice and selling his judgments for bribes, it takes the shape of allowing and sharing in a dishonourable and mischievous system of payment for service, which could not fail to bring with it temptation and discredit, and in which fair reward could not be distinguished from unlawful gain. Such a system it was high time to stop; and in this rough and harsh way, which also satisfied some personal enmities, it was stopped. We may put aside for good the charge on which he was condemned, and which in words he admitted — of being corrupt as a judge. His real fault — and it was a great one — was that he did not in time open his eyes to the wrongness and evil, patent to every one, and to himself as soon as pointed out, of the traditional fashion in his court of eking out by irregular gifts the salary of such an office as his.

Thus Bacon was condemned both to suffering and to dishonour; and, as has been observed, condemned without a trial. But it must also be observed that it was entirely owing to his own act that he had not a trial, and with a trial the opportunity of cross-examining witnesses and of explaining openly the matters urged against him. The proceedings in the Lords were preliminary to the trial; when the time came, Bacon, of his own choice, stopped them from going farther, by his confession and submission. Considering the view which he claimed to take of his own case, his behaviour was wanting in courage and spirit. From the moment that the attack on him shifted from a charge of authorising illegal monopolies to a charge of personal corruption, he never fairly met his accusers. The distress and anxiety, no doubt, broke down his health; and twice, when he was called upon to be in his place in the House of Lords, he was obliged to excuse himself on the ground that he was too ill to leave his bed. But between the time of the first charge and his condemnation seven weeks elapsed; and though he was able to go down to Gorhambury, he never in that time showed himself in the House of Lords. Whether or not, while the Committees were busy in collecting the charges, he would have been allowed to take part, to put questions to the witnesses, or to produce his own, he never attempted to do so;

and by the course he took there was no other opportunity. To have stood his trial could hardly have increased his danger, or aggravated his punishment; and it would only have been worthy of his name and place, if not to have made a fight for his character and integrity, at least to have bravely said what he had made up his mind to admit, and what no one could have said more nobly and pathetically, in open Parliament. But he was cowed at the fierceness of the disapprobation manifest in both Houses. He shrunk from looking his peers and his judges in the face. His friends obtained for him that he should not be brought to the bar, and that all should pass in writing. But they saved his dignity at the expense of his substantial reputation. The observation that the charges against him were not sifted by cross-examination applies equally to his answers to them. The allegations of both sides would have come down to us in a more trustworthy shape if the case had gone on. But to give up the struggle, and to escape by any humiliation from a regular public trial, seems to have been his only thought when he found that the King and Buckingham could not or would not save him.

But the truth is that he knew that a trial of this kind was a trial only in name. He knew that, when a charge of this sort was brought, it was not meant to be really investigated in open court, but to be driven home by proofs carefully prepared beforehand, against which the accused had little chance. He knew, too, that in those days to resist in earnest an accusation was apt to be taken as an insult to the court which entertained it. And further, for the prosecutor to accept a submission and confession without pushing to the formality of a public trial, and therefore a public exposure, was a favour. It was a favour which by his advice, as against the King's honour, had been refused to Suffolk; it was a favour which, in a much lighter charge, had by his advice been refused to his colleague Yelverton only a few months before, when Bacon, in sentencing him, took occasion to expatiate on the heinous guilt of misprisions or mistakes in men in high places. The humiliation was not complete without the trial, but it was for humiliation and not fair investigation that the trial was wanted. Bacon knew that the trial would only prolong his agony, and give a further triumph to his enemies.

That there was any plot against Bacon, and much more that Buckingham to save himself was a party to it, is of course absurd. Buckingham, indeed, was almost the only man in the Lords who said anything for Bacon, and, alone, he voted against his punishment. But considering what Buckingham was, and what he dared to do when he pleased, he was singularly cool in helping Bacon. Williams, the astute Dean of Westminster, who was to be Bacon's successor as Lord Keeper, had got his ear, and advised him not to endanger himself by trying to save delinquents. He did not. Indeed, as the inquiry went on, he began to take the high moral ground; he was shocked at the Chancellor's conduct; he would not have believed that it could have been so bad; his disgrace was richly deserved. Buckingham kept up appearances by saying a word for him from time to time in Parliament, which he knew would be useless, and which he certainly took no measures to make effective. It is sometimes said that Buckingham never knew what dissimulation was. He was capable, at least, of the perfidy and cowardice of utter selfishness. Bacon's conspicuous fall diverted men's thoughts from the far more scandalous wickedness of the great favourite. But though there was no plot, though the blow fell upon Bacon almost accidentally, there were many who rejoiced to be able to drive it home. We can hardly wonder that foremost among them was Coke. This was the end of the long rivalry between Bacon and Coke, from the time that Essex pressed Bacon against Coke in vain to the day when Bacon as Chancellor drove Coke from his seat for his bad law, and as Privy Councillor ordered him to be prosecuted in the Star Chamber for riotously breaking open men's doors to get his daughter. The two men thoroughly disliked and undervalued one another. Coke made light of Bacon's law. Bacon saw clearly Coke's narrowness and ignorance out of that limited legal sphere in which he was supposed to know everything, his prejudiced and interested use of his knowledge, his coarseness and insolence. But now in Parliament Coke was supreme, "our Hercules," as his friends said. He posed as the enemy of all abuses and corruption. He brought his unrivalled, though not always accurate, knowledge of law and history to the service of the Committees, and took care that the Chancellor's name should not be forgotten when it could

be connected with some bad business of patent or Chancery abuse. It was the great revenge of the Common Law on the encroaching and insulting Chancery which had now proved so foul. And he could not resist the opportunity of marking the revenge of professional knowledge over Bacon's airs of philosophical superiority. "To restore things to their original" was his sneer in Parliament, "this, *Instauratio Magna. Instaurare paras — Instaura leges justitiamque prius*." [5]

The charge of corruption was as completely a surprise to Bacon as it was to the rest of the world. And yet, as soon as the blot was hit, he saw in a moment that his position was hopeless — he knew that he had been doing wrong; though all the time he had never apparently given it a thought, and he insisted, what there is every reason to believe, that no present had induced him to give an unjust decision. It was the power of custom over a character naturally and by habit too pliant to circumstances. Custom made him insensible to the evil of receiving recommendations from Buckingham in favour of suitors. Custom made him insensible to the evil of what it seems every one took for granted — receiving gifts from suitors. In the Court of James I. the atmosphere which a man in office breathed was loaded with the taint of gifts and bribes. Presents were as much the rule, as indispensable for those who hoped to get on, as they are now in Turkey. Even in Elizabeth's days, when Bacon was struggling to win her favour, and was in the greatest straits for money, he borrowed £500 to buy a jewel for the Queen. When he was James's servant the giving of gifts became a necessity. New Year's Day brought round its tribute of gold vases and gold pieces to the King and Buckingham. And this was the least. Money was raised by the sale of officers and titles. For £20,000, having previously offered £10,000 in vain, the Chief-Justice of England, Montague, became Lord Mandeville and Treasurer. The bribe was sometimes disguised: a man became a Privy Councillor, like Cranfield, or a Chief-Justice, like Ley (afterwards "the good Earl," "unstained with gold or fee," of Milton's Sonnet), by marrying a cousin or a niece of Buckingham. When Bacon was made a Peer, he had also given him "the making of a Baron;" that is to say, he might raise money by bargaining with some one

who wanted a peerage; when, however, later on, he asked Buckingham for a repetition of the favour, Buckingham gave him a lecture on the impropriety of prodigality, which should make it seem that "while the King was asking money of Parliament with one hand he was giving with the other." How things were in Chancery in the days of the Queen, and of Bacon's predecessors, we know little; but Bacon himself implies that there was nothing new in what he did. "All my lawyers," said James, "are so bred and nursed in corruption that they cannot leave it." Bacon's Chancellorship coincided with the full bloom of Buckingham's favour; and Buckingham set the fashion, beyond all before him, of extravagance in receiving and spending. Encompassed by such assumptions and such customs, Bacon administered the Chancery. Suitors did there what people did everywhere else; they acknowledged by a present the trouble they gave, or the benefit they gained. It may be that Bacon's known difficulties about money, his expensive ways and love of pomp, his easiness of nature, his lax discipline over his servants, encouraged this profuseness of giving. And Bacon let it be. He asked no questions; he knew that he worked hard and well; he knew that it could go on without affecting his purpose to do justice "from the greatest to the groom." A stronger character, a keener conscience, would have faced the question, not only whether he was not setting the most ruinous of precedents, but whether any man could be so sure of himself as to go on dealing justly with gifts in his hands. But Bacon, who never dared to face the question, what James was, what Buckingham was, let himself be spellbound by custom. He knew in the abstract that judges ought to have nothing to do with gifts, and had said so impressively in his charges to them. Yet he went on self-complacent, secure, almost innocent, building up a great tradition of corruption in the very heart of English justice, till the challenge of Parliament, which began in him its terrible and relentless, but most unequal, prosecution of justice against ministers who had betrayed the commonwealth in serving the Crown, woke him from his dream, and made him see, as others saw it, the guilt of a great judge who, under whatever extenuating pretext, allowed the suspicion to arise that he might sell justice. "In the midst of a state of as great affliction as mortal man can endure,"

he wrote to the Lords of the Parliament, in making his submission, “I shall begin with the professing gladness in some things. The first is that hereafter the greatness of a judge or magistrate shall be no sanctuary or protection of guiltiness, which is the beginning of a golden world. The next, that after this example it is like that judges will fly from anything that is in the likeness of corruption as from a serpent.” Bacon’s own judgment on himself, deliberately repeated, is characteristic, and probably comes near the truth. “Howsoever, I acknowledge the sentence just and for reformation’s sake fit,” he writes to Buckingham from the Tower, where, for form’s sake, he was imprisoned for a few miserable days, he yet had been “the justest Chancellor that hath been in the five changes that have been since Sir Nicolas Bacon’s time.” He repeated the same thing yet more deliberately in later times. “*I was the justest judge that was in England these fifty years. But it was the justest censure in Parliament that was these two hundred years.*”

He might have gone on to add, “the Wisest Counsellor; and yet none on whom rested heavier blame; none of whom England might more justly complain.” Good counsels given, submissive acquiescence in the worst — this is the history of his statesmanship. Bacon, whose eye was everywhere, was not sparing of his counsels. On all the great questions of the time he has left behind abundant evidence, not only of what he thought, but of what he advised. And in every case these memorials are marked with the insight, the independence, the breadth of view, and the moderation of a mind which is bent on truth. He started, of course, from a basis which we are now hardly able to understand or allow for, the idea of absolute royal power and prerogative which James had enlarged and hardened out of the Kingship of the Tudors, itself imperious and arbitrary enough, but always seeking, with a tact of which James was incapable, to be in touch and sympathy with popular feeling. But it was a basis which in principle every one of any account as yet held or professed to hold, and which Bacon himself held on grounds of philosophy and reason. He could see no hope for orderly and intelligent government except in a ruler whose wisdom had equal strength to assert itself; and he looked down with incredulity and scorn on the

notion of anything good coming out of what the world then knew or saw of popular opinion or parliamentary government. But when it came to what was wise and fitting for absolute power to do in the way of general measures and policy, he was for the most part right. He saw the inexorable and pressing necessity of putting the finance of the kingdom on a safe footing. He saw the necessity of a sound and honest policy in Ireland. He saw the mischief of the Spanish alliance in spite of his curious friendship with Gondomar, and detected the real and increasing weakness of the Spanish monarchy, which still awed mankind. He saw the growing danger of abuses in Church and State which were left untouched, and were protected by the punishment of those who dared to complain of them. He saw the confusion and injustice of much of that common law of which the lawyers were so proud; and would have attempted, if he had been able, to emulate Justinian, and anticipate the Code Napoleon, by a rational and consistent digest. Above all, he never ceased to impress on James the importance, and, if wisely used, the immense advantages, of his Parliaments. Himself, for great part of his life, an active and popular member of the House of Commons, he saw that not only it was impossible to do without it, but that, if fairly, honourably, honestly dealt with, it would become a source of power and confidence which would double the strength of the Government both at home and abroad. Yet of all this wisdom nothing came. The finance of the kingdom was still ruined by extravagance and corruption in a time of rapidly-developing prosperity and wealth. The wounds of Ireland were unhealed. It was neither peace nor war with Spain, and hot infatuation for its friendship alternated with cold fits of distrust and estrangement. Abuses flourished and multiplied under great patronage. The King's one thought about Parliament was how to get as much money out of it as he could, with as little other business as possible. Bacon's counsels were the prophecies of Cassandra in that so prosperous but so disastrous reign. All that he did was to lend the authority of his presence, in James's most intimate counsels, to policy and courses of which he saw the unwisdom and the perils. James and Buckingham made use of him when they

wanted. But they would have been very different in their measures and their statesmanship if they had listened to him.

Mirabeau said, what of course had been said before him, “On ne vaut, dans la partie exécutive de la vie humaine, que par le caractère.” This is the key to Bacon’s failures as a judge and as a statesman, and why, knowing so much more and judging so much more wisely than James and Buckingham, he must be identified with the misdoings of that ignoble reign. He had the courage of his opinions; but a man wants more than that: he needs the manliness and the public spirit to enforce them, if they are true and salutary. But this is what Bacon had not. He did not mind being rebuffed; he knew that he was right, and did not care. But to stand up against the King, to contradict him after he had spoken, to press an opinion or a measure on a man whose belief in his own wisdom was infinite, to risk not only being set down as a dreamer, but the King’s displeasure, and the ruin of being given over to the will of his enemies, this Bacon had not the fibre or the stiffness or the self-assertion to do. He did not do what a man of firm will and strength of purpose, a man of high integrity, of habitual resolution, would have done. Such men insist when they are responsible, and when they know that they are right; and they prevail, or accept the consequences. Bacon, knowing all that he did, thinking all that he thought, was content to be the echo and the instrument of the cleverest, the foolishest, the vainest, the most pitiably unmanly of English kings.

CHAPTER VII.

BACON’S LAST YEARS.

[1621-1626.]

The tremendous sentences of those days, with their crushing fines, were often worse in sound than in reality. They meant that for the moment a man was defeated and disgraced. But it was quite understood that it did not necessarily follow that they would be enforced in all their severity. The fine might be

remitted, the imprisonment shortened, the ban of exclusion taken off. At another turn of events or caprice the man himself might return to favour, and take his place in Parliament or the Council as if nothing had happened. But, of course, a man might have powerful enemies, and the sentence might be pressed. His fine might be assigned to some favourite; and he might be mined, even if in the long run he was pardoned; or he might remain indefinitely a prisoner. Raleigh had remained to perish at last in dishonour. Northumberland, Raleigh's fellow-prisoner, after fifteen years' captivity, was released this year. The year after Bacon's condemnation such criminals as Lord and Lady Somerset were released from the Tower, after a six years' imprisonment. Southampton, the accomplice of Essex, Suffolk, sentenced as late as 1619 by Bacon for embezzlement, sat in the House of Peers which judged Bacon, and both of them took a prominent part in judging him.

To Bacon the sentence was ruinous. It proved an irretrievable overthrow as regards public life, and, though some parts of it were remitted and others lightened, it plunged his private affairs into trouble which weighed heavily on him for his few remaining years. To his deep distress and horror he had to go to the Tower to satisfy the terms of his sentence. "Good my Lord," he writes to Buckingham, May 31, "procure my warrant for my discharge this day. Death is so far from being unwelcome to me, as I have called for it as far as Christian resolution would permit any time these two months. But to die before the time of his Majesty's grace, in this disgraceful place, is even the worst that could be." He was released after two or three days, and he thanks Buckingham (June 4) for getting him out to do him and the King faithful service— "wherein, by the grace of God, your Lordship shall find that my adversity hath neither *spent* nor *pent* my spirits." In the autumn his fine was remitted — that is, it was assigned to persons nominated by Bacon, who, as the Crown had the first claim on all his goods, served as a protection against his other creditors, who were many and some of them clamorous — and it was followed by his pardon. His successor, Williams, now Bishop of Lincoln, who stood in great fear of Parliament, tried to stop the pardon. The assignment of the fine, he said to Buckingham, was a gross

job— “it is much spoken against, not for the matter (for no man objects to that), but for the manner, which is full of knavery, and a wicked precedent. For by this assignment he is protected from all his creditors, which (I dare say) was neither his Majesty’s nor your Lordship’s meaning.” It was an ill-natured and cowardly piece of official pedantry to plunge deeper a drowning man; but in the end the pardon was passed. It does not appear whether Buckingham interfered to overrule the Lord Keeper’s scruples. Buckingham was certainly about this time very much out of humour with Bacon, for a reason which, more than anything else, discloses the deep meanness which lurked under his show of magnanimity and pride. He had chosen this moment to ask Bacon for York House. This meant that Bacon would never more want it. Even Bacon was stung by such a request to a friend in his condition, and declined to part with it; and Buckingham accordingly was offended, and made Bacon feel it. Indeed, there is reason to think with Mr. Spedding that for the sealing of his pardon Bacon was indebted to the good offices with the King, not of Buckingham, but of the Spaniard, Gondomar, with whom Bacon had always been on terms of cordiality and respect, and who at this time certainly “brought about something on his behalf, which his other friends either had not dared to attempt or had not been able to obtain.”

But, though Bacon had his pardon, he had not received permission to come within the verge of the Court, which meant that he could not live in London. His affairs were in great disorder, his health was bad, and he was cut off from books. He wrote an appeal to the Peers who had condemned him, asking them to intercede with the King for the enlargement of his liberty. “I am old,” he wrote, “weak, ruined, in want, a very subject of pity.” The Tower at least gave him the neighbourhood of those who could help him. “There I could have company, physicians, conference with my creditors and friends about my debts and the necessities of my estate, helps for my studies and the writings I have in hand. Here I live upon the sword-point of a sharp air, endangered if I go abroad, dulled if I stay within, solitary and comfortless, without company, banished from all opportunities to treat with any to do myself good, and to help out my wrecks.” If

the Lords would recommend his suit to the King, “You shall do a work of charity and nobility, you shall do me good, you shall do my creditors good, and it may be you shall do posterity good, if out of the carcase of dead and rotten greatness (as out of Samson’s lion) there may be honey gathered for the use of future times.” But Parliament was dissolved before the touching appeal reached them; and Bacon had to have recourse to other expedients. He consulted Selden about the technical legality of the sentence. He appealed to Buckingham, who vouchsafed to appear more placable. Once more he had recourse to Gondomar, “in that solitude of friends, which is the base-court of adversity,” as a man whom he had “observed to have the magnanimity of his own nation and the cordiality of ours, and I am sure the wit of both” — and who had been equally kind to him in “both his fortunes;” and he proposed through Gondomar to present Gorhambury to Buckingham “for nothing,” as a peace-offering. But the purchase of his liberty was to come in another way. Bacon had reconciled himself to giving up York House; but now Buckingham would not have it: he had found another house, he said, which suited him as well. That is to say, he did not now choose to have York House from Bacon himself; but he meant to have it. Accordingly, Buckingham let Bacon know through a friend of Bacon’s, Sir Edward Sackville, that the price of his liberty to live in London was the cession of York House — not to Buckingham, but of all men in the world, to Lionel Cranfield, the man who had been so bitter against Bacon in the House of Commons. This is Sir Edward Sackville’s account to Bacon of his talk with Buckingham; it is characteristic of every one concerned:

“In the forenoon he laid the law, but in the afternoon he preached the gospel; when, after some revivations of the old distaste concerning York House, he most nobly opened his heart unto me; wherein I read that which augured much good towards you. After which revelation the book was again sealed up, and must in his own time only by himself be again manifested unto you. I have leave to remember some of the vision, and am not forbidden to write it. He vowed (not court like), but constantly to appear your friend so much, as if his Majesty should abandon the care of you, you should share his fortune with him. He

pleased to tell me how much he had been beholden to you, how well he loved you, how unkindly he took the denial of your house (for so he will needs understand it); but the close for all this was harmonious, since he protested he would seriously begin to study your ends, now that the world should see he had no ends on you. He is in hand with the work, and therefore will by no means accept of your offer, though I can assure you the tender hath much won upon him, and mellowed his heart towards you, and your genius directed you aright when you writ that letter of denial to the Duke. The King saw it, and all the rest, which made him say unto the Marquis, you played an after-game well; and that now he had no reason to be much offended.

"I have already talked of the Revelation, and now am to speak in apocalyptical language, which I hope you will rightly comment: whereof if you make difficulty, the bearer can help you with the key of the cypher.

"My Lord Falkland by this time hath showed you London from Highgate. *If York House were gone, the town were yours*, and all your straitest shackles clean off, besides more comfort than the city air only. The Marquis would be exceeding glad the Treasurer had it. This I know; yet this you must not know from me. Bargain with him presently, upon as good conditions as you can procure, so you have direct motion from the Marquis to let him have it. Seem not to dive into the secret of it, though you are purblind if you see not through it. I have told Mr. Meautys how I would wish your Lordship now to make an end of it. From him I beseech you take it, and from me only the advice to perform it. If you part not speedily with it, you may defer the good which is approaching near you, and disappointing other aims (which must either shortly receive content or never), perhaps anew yield matter of discontent, though you may be indeed as innocent as before. Make the Treasurer believe that since the Marquis will by no means accept of it, and that you must part with it, you are more willing to pleasure him than anybody else, because you are given to understand my Lord Marquis so inclines; which inclination, if the Treasurer shortly send unto you about it, desire may be more clearly manifested than as yet it hath been; since as I remember none hitherto hath told you *in terminis terminantibus* that the

Marquis desires you should gratify the Treasurer. I know that way the hare runs, and that my Lord Marquis longs until Cranfield hath it; and so I wish too, for your good; yet would not it were absolutely passed until my Lord Marquis did send or write unto you to let him have it; for then his so disposing of it were but the next degree removed from the immediate acceptance of it, and your Lordship freed from doing it otherwise than to please him, and to comply with his own will and way."

It need hardly be said that when Cranfield got it, it soon passed into Buckingham's hands. "Bacon consented to part with his house, and Buckingham in return consented to give him his liberty." Yet Bacon could write to him, "low as I am, I had rather sojourn in a college in Cambridge than recover a good fortune by any other but yourself." "As for York House," he bids Toby Matthews to let Buckingham know, "that *whether in a straight line or a compass line*, I meant it for his Lordship, in the way which I thought might please him best." But liberty did not mean either money or recovered honour. All his life long he had made light of being in debt; but since his fall this was no longer a condition easy to bear. He had to beg some kind of pension of the King. He had to beg of Buckingham; "a small matter for my debts would do me more good now than double a twelvemonth hence. I have lost six thousand by the year, besides caps and courtesies. Two things I may assure your Lordship. The one, that I shall lead such a course of life as whatsoever the King doth for me shall rather sort to his Majesty's and your Lordship's honour than to envy; the other, that whatsoever men talk, I can play the good husband, and the King's bounty shall not be lost."

It might be supposed from the tone of these applications that Bacon's mind was bowed down and crushed by the extremity of his misfortune. Nothing could be farther from the truth. In his behaviour during his accusation there was little trace of that high spirit and fortitude shown by far inferior men under like disasters. But the moment the tremendous strain of his misfortunes was taken off, the vigour of his mind recovered itself. The buoyancy of his hopefulness, the elasticity of his energy, are as remarkable as his profound depression. When the

end was approaching, his thoughts turned at once to other work to be done, ready in plan, ready to be taken up and finished. At the close of his last desperate letter to the King he cannot resist finishing at once with a jest, and with the prospect of two great literary undertakings —

"This is my last suit which I shall make to your Majesty in this business, prostrating myself at your mercy seat, after fifteen years service, wherein I have served your Majesty in my poor endeavours with an entire heart, and, as I presumed to say unto your Majesty, am still a virgin for matters that concern your person and crown; and now only craving that after eight steps of honour I be not precipitated altogether. But because he that hath taken bribes is apt to give bribes, I will go furder, and present your Majesty with a bribe. For if your Majesty will give me peace and leisure, and God give me life, I will present your Majesty with a good history of England, and a better digest of your laws."

The Tower did, indeed, to use a word of the time, "mate" him. But the moment he was out of it, his quick and fertile mind was immediately at work in all directions, reaching after all kinds of plans, making proof of all kinds of expedients to retrieve the past, arranging all kinds of work according as events might point out the way. His projects for history, for law, for philosophy, for letters, occupy quite as much of his thoughts as his pardon and his debts; and they, we have seen, occupied a good deal. If he was pusillanimous in the moment of the storm, his spirit, his force, his varied interests, returned the moment the storm was past. His self-reliance, which was boundless, revived. He never allowed himself to think, however men of his own time might judge him, that the future world would mistake him. "*Aliquis fui inter vivos*," he writes to Gondomar, "*neque omnino intermoriar apud posteros*." Even in his time he did not give up the hope of being restored to honour and power. He compared himself to Demosthenes, to Cicero, to Seneca, to Marcus Livius, who had been condemned for corrupt dealings as he had been, and had all recovered favour and position. Lookers-on were puzzled and shocked. "He has," writes Chamberlain, "no manner of feeling of his fall, but continuing vain and idle in all his humours

as when he was at the highest." "I am said," Bacon himself writes, "to have a feather in my head."

Men were mistaken. His thoughts were, for the moment, more than ever turned to the future; but he had not given up hope of having a good deal to say yet to the affairs of the present. Strangely enough, as it seems to us, in the very summer after that fatal spring of 1621 the King called for his opinion concerning the reformation of Courts of Justice; and Bacon, just sentenced for corruption and still unpardoned, proceeds to give his advice as if he were a Privy Councillor in confidential employment. Early in the following year he, according to his fashion, surveyed his position, and drew up a paper of memoranda, like the notes of the *Commentarius Solutus* of 1608, about points to be urged to the King at an interview. Why should not the King employ him again? "Your Majesty never chid me;" and as to his condemnation, "as the fault was not against your Majesty, so my fall was not your act." "Therefore," he goes on, "if your Majesty do at any time find it fit for your affairs to employ me publicly upon the stage, I shall so live and spend my time as neither discontinuance shall disable me nor adversity shall discourage me, nor anything that I do give any new scandal or envy upon me." He insists very strongly that the King's service never miscarried in his hands, for he simply carried out the King's wise counsels. "That his Majesty's business never miscarried in my hands I do not impute to any extraordinary ability in myself, but to my freedom from any particular, either friends or ends, and my careful receipt of his directions, being, as I have formerly said to him, but as a bucket and cistern to that fountain — a bucket to draw forth, a cistern to preserve." He is not afraid of the apparent slight to the censure passed on him by Parliament. "For envy, it is an almanack of the old year, and as a friend of mine said, *Parliament died penitent towards me*." "What the King bestows on me will be further seen than on Paul's steeple." "There be mountebanks, as well in the civil body as in the natural; I ever served his Majesty with modesty; no shouting, no undertaking." In the odd fashion of the time — a fashion in which no one more delighted than himself — he lays hold of sacred words to give point to his argument.

"I may allude to the three petitions of the Litany — *Libera nos Domine*; *parce nobis, Domine*; *exaudi nos, Domine*. In the first, I am persuaded that his Majesty had a mind to do it, and could not conveniently in respect of his affairs. In the second, he hath done it in my fine and pardon. In the third, he hath likewise performed, in restoring to the light of his countenance."

But if the King did not see fit to restore him to public employment, he would be ready to give private counsel; and he would apply himself to any "literary province" that the King appointed. "I am like ground fresh. If I be left to myself I will graze and bear natural philosophy; but if the King will plough me up again, and sow me with anything, I hope to give him some yield." "Your Majesty hath power; I have faith. Therefore a miracle may be wrought." And he proposes, for matters in which his pen might be useful, first, as "active" works, the recompiling of laws; the disposing of wards, and generally the education of youth; the regulation of the jurisdiction of Courts; and the regulation of Trade; and for "contemplative," the continuation of the history of Henry VIII.; a general treatise *de Legibus et Justitia*; and the "Holy War" against the Ottomans.

When he wrote this he had already shown what his unquelled energy could accomplish. In the summer and autumn after his condemnation, amid all the worries and inconveniences of that time, moving about from place to place, without his books, and without free access to papers and records, he had written his *History of Henry VII*. The theme had, no doubt, been long in his head. But the book was the first attempt at philosophical history in the language, and it at once takes rank with all that the world had yet seen, in classical times and more recently in Italy, of such history. He sent the book, among other persons, to the Queen of Bohemia, with a phrase, the translation of a trite Latin commonplace, which may have been the parent of one which became famous in our time; and with an expression of absolute confidence in the goodness of his own work.

"I have read in books that it is accounted a great bliss for a man to have *Leisure with Honour*. That was never my fortune. For time was, I had Honour without Leisure; and now I have *Leisure without Honour*.... But my desire is now to have *Leisure without Loitering*, and not to become an abbey-lubber, as

the old proverb was, but to yield some fruit of my private life.... If King Henry were alive again, I hope verily he would not be so angry with me for not flattering him, as well pleased in seeing himself so truly described in colours that will last and be believed."

But the tide had turned against him for good. A few fair words, a few grudging doles of money to relieve his pressing wants, and those sometimes intercepted and perhaps never rightly granted from an Exchequer which even Cranfield's finance could not keep filled, were all the graces that descended upon him from those fountains of goodness in which he professed to trust with such boundless faith. The King did not want him, perhaps did not trust him, perhaps did not really like him. When the *Novum Organum* came out, all that he had to say about it was in the shape of a profane jest that "it was like the peace of God — it passed all understanding." Other men had the ear of Buckingham; shrewd, practical men of business like Cranfield, who hated Bacon's loose and careless ways, or the clever ecclesiastic Williams, whose counsel had steered Buckingham safely through the tempest that wrecked Bacon, and who, with no legal training, had been placed in Bacon's seat. "I thought," said Bacon, "that I should have known my successor." Williams, for his part, charged Bacon with trying to cheat his creditors, when his fine was remitted. With no open quarrel, Bacon's relations to Buckingham became more ceremonious and guarded; the "My singular good Lord" of the former letters becomes, now that Buckingham had risen so high and Bacon had sunk so low, "Excellent Lord." The one friend to whom Bacon had once wished to owe everything had become the great man, now only to be approached with "sweet meats" and elaborate courtesy. But it was no use. His full pardon Bacon did not get, though earnestly suing for it, that he might not "die in ignominy." He never sat again in Parliament. The Provostship of Eton fell vacant, and Bacon's hopes were kindled. "It were a pretty cell for my fortune. The College and School I do not doubt but I shall make to flourish." But Buckingham had promised it to some nameless follower, and by some process of exchange it went to Sir Henry Wotton. His English history was offered in vain. His digest of the Laws was offered in vain. In vain

he wrote a memorandum on the regulation of usury; notes of advice to Buckingham; elaborate reports and notes of speeches about a war with Spain, when that for a while loomed before the country. In vain he affected an interest which he could hardly have felt in the Spanish marriage, and the escapade of Buckingham and Prince Charles, which "began," he wrote, "like a fable of the poets, but deserved all in a piece a worthy narration." In vain, when the Spanish marriage was off and the French was on, he proposed to offer to Buckingham "his service to live a summer as upon mine own delight at Paris, to settle a fast intelligence between France and us;" "I have somewhat of the French," he said, "I love birds, as the King doth." Public patronage and public employment were at an end for him. His petitions to the King and Buckingham ceased to be for office, but for the clearing of his name and for the means of living. It is piteous to read the earnestness of his requests. "Help me (dear Sovereign lord and master), pity me so far as that I who have borne a bag be not now in my age forced in effect to bear a wallet." The words are from a carefully-prepared and rhetorical letter which was not sent, but they express what he added to a letter presenting the *De Augmentis; "det Vestra Majestas obolum Belisario*." Again, "I prostrate myself at your Majesty's feet; I your ancient servant, now sixty-four years old in age, and three years and five months old in misery. I desire not from your Majesty means, nor place, nor employment, but only after so long a time of expiation, a complete and total remission of the sentence of the Upper House, to the end that blot of ignominy may be removed from me, and from my memory and posterity, that I die not a condemned man, but may be to your Majesty, as I am to God, *nova creatura*." But the pardon never came. Sir John Bennett, who had been condemned as a corrupt judge by the same Parliament, and between whose case and Bacon's there was as much difference, "I will not say as between black and white, but as between black and gray," had got his full pardon, "and they say shall sit in Parliament." Lord Suffolk had been one of Bacon's judges. "I hope I deserve not to be the only outcast." But whether the Court did not care, or whether, as he once suspected, there was some old enemy like Coke, who "had a tooth against him," and was watching any favour shown

him, he died without his wish being fulfilled, “to live out of want and to die out of ignominy.”

Bacon was undoubtedly an impoverished man, and straitened in his means; but this must be understood as in relation to the rank and position which he still held, and the work which he wanted done for the *Instauratio*. His will, dated a few months before his death, shows that it would be a mistake to suppose that he was in penury. He no doubt often wanted ready money, and might be vexed by creditors. But he kept a large household, and was able to live in comfort at Gray’s Inn or at Gorhambury. A man who speaks in his will of his “four coach geldings and his best caroache,” besides many legacies, and who proposes to found two lectures at the universities, may have troubles about debts and be cramped in his expenditure, but it is only relatively to his station that he can be said to be poor. And to subordinate officers of the Treasury who kept him out of his rights, he could still write a sharp letter, full of his old force and edge. A few months before his death he thus wrote to the Lord Treasurer Ley, who probably had made some difficulty about a claim for money:

“MY LORD, — I humbly entreat your Lordship, and (if I may use the word) advise your Lordship to make me a better answer. Your Lordship is interested in honour, in the opinion of all that hear how I am dealt with. If your Lordship malice me for Long’s cause, surely it was one of the justest businesses that ever was in Chancery. I will avouch it; and how deeply I was tempted therein, your Lordship knoweth best. Your Lordship may do well to think of your grave as I do of mine; and to beware of hardness of heart. And as for fair words, it is a wind by which neither your Lordship nor any man else can sail long. Howsoever, I am the man that shall give all due respects and reverence to your great place.

“20th June, 1625.
FR. ST. ALBAN.”

Bacon always claimed that he was not “vindicative.” But considering how Bishop Williams, when he was Lord Keeper, had charged Bacon with “knavery” and “deceiving his creditors” in the arrangements about his fine, it is not a little strange to find that at the end of his life Bacon had so completely made friends with him that he chose him as the person to whom he meant to leave his speeches and letters, which he was “willing should not be lost,” and also the charge of superintending two foundations of £200 a year for Natural Science at the universities. And the Bishop accepted the charge.

The end of this, one of the most pathetic of histories, was at hand; the end was not the less pathetic because it came in so homely a fashion. On a cold day in March he stopped his coach in the snow on his way to Highgate, to try the effect of cold in arresting putrefaction. He bought a hen from a woman by the way, and stuffed it with snow. He was taken with a bad chill, which forced him to stop at a strange house, Lord Arundel’s, to whom he wrote his last letter — a letter of apology for using his house. He did not write the letter as a dying man. But disease had fastened on him. A few days after, early on Easter morning, April 9, 1626, he passed away. He was buried at St. Albans, in the Church of St. Michael, “the only Christian church within the walls of old Verulam.” “For my name and memory,” he said in his will, “I leave it to men’s charitable speeches, and to foreign nations and the next ages.” So he died: the brightest, richest, largest mind but one, in the age which had seen Shakespeare and his fellows; so bright and rich and large that there have been found those who identify him with the writer of *Hamlet* and *Othello*. That is idle. Bacon could no more have written the plays than Shakespeare could have prophesied the triumphs of natural philosophy. So ended a career, than which no other in his time had grander and nobler aims — aims, however mistaken, for the greatness and good of England; aims for the enlargement of knowledge and truth, and for the benefit of mankind. So ended a career which had mounted slowly and painfully, but resolutely, to the highest pinnacle of greatness — greatness full of honour and beneficent activity — suddenly to plunge down to depths where honour and hope were irrecoverable. So closed, in disgrace and disappointment and neglect, the last sad

chapter of a life which had begun so brightly, which had achieved such permanent triumphs, which had lost itself so often in the tangles of insincerity and evil custom, which was disfigured and marred by great misfortunes, and still more by great mistakes of his own, which was in many ways misunderstood not only by his generation but by himself, but which he left in the constant and almost unaccountable faith that it would be understood and greatly honoured by posterity. With all its glories, it was the greatest shipwreck, the greatest tragedy, of an age which saw many.

But in these gloomy and dreary days of depression and vain hope to which his letters bear witness— "three years and five months old in misery," again later, "a long cleansing week of five years' expiation and more" — his interest in his great undertaking and his industry never flagged. The King did not want what he offered, did not want his histories, did not want his help about law. Well, then, he had work of his own on which his heart was set; and if the King did not want his time, he had the more for himself. Even in the busy days of his Chancellorship he had prepared and carried through the press the *Novum Organum*, which he published on the very eve of his fall. It was one of those works which quicken a man's powers, and prove to him what he can do; and it had its effect. His mind was never more alert than in these years of adversity, his labour never more indefatigable, his powers of expression never more keen and versatile and strong. Besides the political writings of grave argument for which he found time, these five years teem with the results of work. In the year before his death he sketched out once more, in a letter to a Venetian correspondent, Fra Fulgenzio, the friend of Sarpi, the plan of his great work, on which he was still busy, though with fast diminishing hopes of seeing it finished. To another foreign correspondent, a professor of philosophy at Annecy, and a distinguished mathematician, Father Baranzan, who had raised some questions about Bacon's method, and had asked what was to be done with metaphysics, he wrote in eager acknowledgment of the interest which his writings had excited, and insisting on the paramount necessity, above everything, of the observation of facts and of natural history, out of which philosophy may be built. But the most

comprehensive view of his intellectual projects in all directions, "the fullest account of his own personal feelings and designs as a writer which we have from his own pen," is given in a letter to the venerable friend of his early days, Bishop Andrewes, who died a few months after him. Part, he says, of his *Instauratio*, "the work in mine own judgement (*si nunquam fallit imago*) I do most esteem," has been published; but because he "doubts that it flies too high over men's heads," he proposes "to draw it down to the sense" by examples of Natural History. He has enlarged and translated the *Advancement* into the *De Augmentis*. "Because he could not altogether desert the civil person that he had borne," he had begun a work on Laws, intermediate between philosophical jurisprudence and technical law. He had hoped to compile a digest of English law, but found it more than he could do alone, and had laid it aside. The *Instauratio* had contemplated the good of men "in the dowries of nature;" the *Laws*, their good "in society and the dowries of government." As he owed duty to his country, and could no longer do it service, he meant to do it honour by his history of Henry VII. His *Essays* were but "recreations;" and remembering that all his writings had hitherto "gone all into the City and none into the Temple," he wished to make "some poor oblation," and therefore had chosen an argument mixed of religious and civil considerations, the dialogue of "an Holy War" against the Ottoman, which he never finished, but which he intended to dedicate to Andrewes, "in respect of our ancient and private acquaintance, and because amongst the men of our times I hold you in special reverence."

The question naturally presents itself, in regard to a friend of Bishop Andrewes, What was Bacon as regards religion? And the answer, it seems to me, can admit of no doubt. The obvious and superficial thing to say is that his religion was but an official one, a tribute to custom and opinion. But it was not so. Both in his philosophical thinking, and in the feelings of his mind in the various accidents and occasions of life, Bacon was a religious man, with a serious and genuine religion. His sense of the truth and greatness of religion was as real as his sense of the truth and greatness of nature; they were interlaced together, and could not be separated, though they were to be studied separately

and independently. The call, repeated through all his works from the earliest to the last, *Da Fidel quæ Fidel sunt*, was a warning against confusing the two, but was an earnest recognition of the claims of each. The solemn religious words in which his prefaces and general statements often wind up with thanksgiving and hope and prayer, are no mere words of course; they breathe the spirit of the deepest conviction. It is true that he takes the religion of Christendom as he finds it. The grounds of belief, the relation of faith to reason, the profounder inquiries into the basis of man's knowledge of the Eternal and Invisible, are out of the circle within which he works. What we now call the philosophy of religion is absent from his writings. In truth, his mind was not qualified to grapple with such questions. There is no sign in his writings that he ever tried his strength against them; that he ever cared to go below the surface into the hidden things of mind, and what mind deals with above and beyond sense — those metaphysical difficulties and depths, as we call them, which there is no escaping, and which are as hard to explore and as dangerous to mistake as the forces and combinations of external nature. But it does not follow, because he had not asked all the questions that others have asked, that he had not thought out his reasonable faith. His religion was not one of mere vague sentiment: it was the result of reflection and deliberate judgment. It was the discriminating and intelligent Church of England religion of Hooker and Andrewes, which had gone back to something deeper and nobler in Christianity than the popular Calvinism of the earlier Reformation; and though sternly hostile to the system of the Papacy, both on religious and political grounds, attempted to judge it with knowledge and justice. This deliberate character of his belief is shown in the remarkable Confession of Faith which he left behind him: a closely-reasoned and nobly-expressed survey of Christian theology— "a *summa theologiæ*, digested into seven pages of the finest English of the days when its tones were finest." "The entire scheme of Christian theology," as Mr. Spedding says, "is constantly in his thoughts; underlies everything; defines for him the limits of human speculation; and, as often as the course of inquiry touches at any point the boundary line, never fails to present itself. There is hardly any occasion or

any kind of argument into which it does not at one time or another incidentally introduce itself." Doubtless it was a religion which in him was compatible, as it has been in others, with grave faults of temperament and character. But it is impossible to doubt that it was honest, that it elevated his thoughts, that it was a refuge and stay in the times of trouble.

CHAPTER VIII.

BACON'S PHILOSOPHY.

Bacon was one of those men to whom posterity forgives a great deal for the greatness of what he has done and attempted for posterity. It is idle, unless all honest judgment is foregone, to disguise the many deplorable shortcomings of his life; it is unjust to have one measure for him, and another for those about him and opposed to him. But it is not too much to say that in temper, in honesty, in labour, in humility, in reverence, he was the most perfect example that the world had yet seen of the student of nature, the enthusiast for knowledge. That such a man was tempted and fell, and suffered the Nemesis of his fall, is an instance of the awful truth embodied in the tragedy of *Faust*. But his genuine devotion, so unwearied and so paramount, to a great idea and a great purpose for the good of all generations to come, must shield him from the insult of Pope's famous and shallow epigram. Whatever may have been his sins, and they were many, he cannot have been the "meanest of mankind," who lived and died, holding unaltered, amid temptations and falls, so noble a conception of the use and calling of his life: the duty and service of helping his brethren to know as they had never yet learned to know. That thought never left him; the obligations it imposed were never forgotten in the crush and heat of business; the toils, thankless at the time, which it heaped upon him in addition to the burdens of public life were never refused. Nothing diverted him, nothing made him despair. He was not discouraged because he was not understood. There never was any one in whose life the "*Souveraineté du but*" was more certain and more apparent; and that object was the second greatest that man can have. To teach men to know is only next to making them good.

The Baconian philosophy, the reforms of the *Novum Organum*, the method of experiment and induction, are commonplaces, and sometimes lead to a misconception of what Bacon did. Bacon is, and is not, the founder of modern

science. What Bacon believed could be done, what he hoped and divined, for the correction and development of human knowledge, was one thing; what his methods were, and how far they were successful, is another. It would hardly be untrue to say that though Bacon is the parent of modern science, his methods contributed nothing to its actual discoveries; neither by possibility could they have done so. The great and wonderful work which the world owes to him was in the idea, and not in the execution. The idea was that the systematic and wide examination of facts was the first thing to be done in science, and that till this had been done faithfully and impartially, with all the appliances and all the safeguards that experience and forethought could suggest, all generalisations, all anticipations from mere reasoning, must be adjourned and postponed; and further, that sought on these conditions, knowledge, certain and fruitful, beyond all that men then imagined, could be attained. His was the faith of the discoverer, the imagination of the poet, the voice of the prophet. But his was not the warrior's arm, the engineer's skill, the architect's creativeness. "I only sound the clarion," he says, "but I enter not into the battle;" and with a Greek quotation very rare with him, he compares himself to one of Homer's peaceful heralds, χαίρετε κήρυκες, Δίος ἄγγελοι ἠδὲ καὶ ἀνδρῶν. Even he knew not the full greatness of his own enterprise. He underrated the vastness and the subtlety of nature. He overrated his own appliances to bring it under his command. He had not that incommunicable genius and instinct of the investigator which in such men as Faraday close hand to hand with phenomena. His weapons and instruments wanted precision; they were powerful up to a certain point, but they had the clumsiness of an unpractised time. Cowley compared him to Moses on Pisgah surveying the promised land; it was but a distant survey, and Newton was the Joshua who began to take possession of it.

The idea of the great enterprise, in its essential outline, and with a full sense of its originality and importance, was early formed, and was even sketched on paper with Bacon's characteristic self-reliance when he was but twenty-five. Looking back, in a letter written in the last year of his life, on the ardour and constancy with which he had clung to his faith— "in that purpose my mind

never waxed old; in that long interval of time it never cooled" — he remarks that it was then "forty years since he put together a youthful essay on these matters, which with vast confidence I called by the high-sounding title, The Greatest Birth of Time." "The Greatest Birth of Time," whatever it was, has perished, though the name, altered to "Partus Temporis *Masculus*" has survived, attached to some fragments of uncertain date and arrangement. But in very truth the child was born, and, as Bacon says, for forty years grew and developed, with many changes yet the same. Bacon was most tenacious, not only of ideas, but even of the phrases, images, and turns of speech in which they had once flashed on him and taken shape in his mind. The features of his undertaking remained the same from first to last, only expanded and enlarged as time went on and experience widened; his conviction that the knowledge of nature, and with it the power to command and to employ nature, were within the capacity of mankind and might be restored to them; the certainty that of this knowledge men had as yet acquired but the most insignificant part, and that all existing claims to philosophical truth were as idle and precarious as the guesses and traditions of the vulgar; his belief that no greater object could be aimed at than to sweep away once and for ever all this sham knowledge and all that supported it, and to lay an entirely new and clear foundation to build on for the future; his assurance that, as it was easy to point out with fatal and luminous certainty the rottenness and hollowness of all existing knowledge and philosophy, so it was equally easy to devise and practically apply new and natural methods of investigation and construction, which should replace it by knowledge of infallible truth and boundless fruitfulness. His object — to gain the key to the interpretation of nature; his method — to gain it, not by the means common to all previous schools of philosophy, by untested reasonings and imposing and high-sounding generalisations, but by a series and scale of rigorously verified inductions, starting from the lowest facts of experience to discoveries which should prove and realise themselves by leading deductively to practical results — these, in one form or another, were the theme of his philosophical writings from the earliest sight of them that we gain.

He had disclosed what was in his mind in the letter to Lord Burghley, written when he was thirty-one (1590/91), in which he announced that he had "taken all knowledge for his province," to "purge it of 'frivolous disputations' and 'blind experiments,' and that whatever happened to him, he meant to be a 'true pioneer in the mine of truth.'" But the first public step in the opening of his great design was the publication in the autumn of 1605 of the *Advancement of Learning*, a careful and balanced report on the existing stock and deficiencies of human knowledge. His endeavours, as he says in the *Advancement* itself, are "but as an image in a cross-way, that may point out the way, but cannot go it." But from this image of his purpose, his thoughts greatly widened as time went on. The *Advancement*, in part at least, was probably a hurried work. It shadowed out, but only shadowed out, the lines of his proposed reform of philosophical thought; it showed his dissatisfaction with much that was held to be sound and complete, and showed the direction of his ideas and hopes. But it was many years before he took a further step. Active life intervened. In 1620, at the height of his prosperity, on the eve of his fall, he published the long meditated *Novum Organum*, the avowed challenge to the old philosophies, the engine and instrument of thought and discovery which was to put to shame and supersede all others, containing, in part at least, the principles of that new method of the use of experience which was to be the key to the interpretation and command of nature, and, together with the method, an elaborate but incomplete exemplification of its leading processes. Here were summed up, and stated with the most solemn earnestness, the conclusions to which long study and continual familiarity with the matters in question had led him. And with the *Novum Organum* was at length disclosed, though only in outline, the whole of the vast scheme in all its parts, object, method, materials, results, for the "Instauration" of human knowledge, the restoration of powers lost, disused, neglected, latent, but recoverable by honesty, patience, courage, and industry.

The *Instauratio*, as he planned the work, "is to be divided," says Mr. Ellis, "into six portions, of which the *first* is to contain a general survey of the present state of knowledge. In the *second*, men are to be taught how to use their

understanding aright in the investigation of nature. In the *third*, all the phenomena of the universe are to be stored up as in a treasure-house, as the materials on which the new method is to be employed. In the *fourth*, examples are to be given of its operation and of the results to which it leads. The *fifth* is to contain what Bacon had accomplished in natural philosophy *without* the aid of his own method, *ex eodem intellectûs usu quem alii in inquirendo et inveniendo adhibere consueverunt*. It is therefore less important than the rest, and Bacon declares that he will not bind himself to the conclusions which it contains. Moreover, its value will altogether cease when the *sixth* part can be completed, wherein will be set forth the new philosophy — the results of the application of the new method to all the phenomena of the universe. But to complete this, the last part of the *Instauratio*, Bacon does not hope; he speaks of it as a thing, *et supra vires et ultra spes nostras collocata*." — *Works*, i. 71.

The *Novum Organum*, itself imperfect, was the crown of all that he lived to do. It was followed (1622) by the publication, intended to be periodical, of materials for the new philosophy to work upon, particular sections and classes of observations on phenomena — the *History of the Winds*, the *History of Life and Death*. Others were partly prepared but not published by him. And finally, in 1623, he brought out in Latin a greatly enlarged recasting of the *Advancement*; the nine books of the "*De Augmentis*." But the great scheme was not completed; portions were left more or less finished. Much that he purposed was left undone, and could not have been yet done at that time.

But the works which he published represent imperfectly the labour spent on the undertaking. Besides these there remains a vast amount of unused or rejected work, which shows how it was thought out, rearranged, tried first in one fashion and then in another, recast, developed. Separate chapters, introductions, "experimental essays and discarded beginnings," treatises with picturesque and imaginative titles, succeeded one another in that busy work-shop; and these first drafts and tentative essays have in them some of the freshest and most felicitous forms of his thoughts. At one time his enterprise, connecting itself with his own life and mission, rose before his imagination and kindled his feelings, and

embodied itself in the lofty and stately "Proem" already quoted. His quick and brilliant imagination saw shadows and figures of his ideas in the ancient mythology, which he worked out with curious ingenuity and often much poetry in his *Wisdom of the Ancients*. Towards the end of his life he began to embody his thoughts and plans in a philosophical tale, which he did not finish — the *New Atlantis* — a charming example of his graceful fancy and of his power of easy and natural story-telling. Between the *Advancement* and the *Novum Organum* (1605-20) much underground work had been done. "He had finally (about 1607) settled the plan of the *Great Instauration*, and began to call it by that name." The plan, first in three or four divisions, had been finally digested into six. Vague outlines had become definite and clear. Distinct portions had been worked out. Various modes of treatment had been tried, abandoned, modified. Prefaces were written to give the sketch and purpose of chapters not yet composed. The *Novum Organum* had been written and rewritten twelve times over. Bacon kept his papers, and we can trace in the unused portion of those left behind him much of the progress of his work, and the shapes which much of it went through. The *Advancement* itself is the filling-out and perfecting of what is found in germ, meagre and rudimentary, in a *Discourse in Praise of Knowledge*, written in the days of Elizabeth, and in some Latin chapters of an early date, the *Cogitationes de Scientia Humana*, on the limits and use of knowledge, and on the relation of natural history to natural philosophy. These early essays, with much of the same characteristic illustration, and many of the favourite images and maxims and texts and phrases, which continue to appear in his writings to the end, contain the thoughts of a man long accustomed to meditate and to see his way on the new aspects of knowledge opening upon him. And before the *Advancement* he had already tried his hand on a work intended to be in two books, which Mr. Ellis describes as a "great work on the Interpretation of Nature," the "earliest type of the *Instauratio*," and which Bacon called by the enigmatical name of *Valerius Terminus*. In it, as in a second draft, which in its turn was superseded by the *Advancement*, the line of thought of the Latin *Cogitationes* reappears, expanded and more carefully ordered; it contains also the first sketch of his certain and

infallible method for what he calls the "freeing of the direction" in the search after Truth, and the first indications of the four classes of "Idols" which were to be so memorable a portion of Bacon's teaching. And between the *Advancement* and the *Novum Organum* at least one unpublished treatise of great interest intervened, the *Visa et Cogitata*, on which he was long employed, and which he brought to a finished shape, fit to be submitted to his friends and critics, Sir Thomas Bodley and Bishop Andrewes. It is spoken of as a book to be "imparted *sicut videbitur*," in the review which he made of his life and objects soon after he was made Solicitor in 1608. A number of fragments also bear witness to the fierce scorn and wrath which possessed him against the older and the received philosophies. He tried his hand at declamatory onslaughts on the leaders of human wisdom, from the early Greeks and Aristotle down to the latest "novellists;" and he certainly succeeded in being magnificently abusive. But he thought wisely that this was not the best way of doing what in the *Commentarius Solutus* he calls on himself to do— "taking a greater confidence and authority in discourses of this nature, *tanquam sui certus et de alto despiciens*;" and the rhetorical *Redargutio Philosophiarum* and writings of kindred nature were laid aside by his more serious judgment. But all these fragments witness to the immense and unwearied labour bestowed in the midst of a busy life on his undertaking; they suggest, too, the suspicion that there was much waste from interruption, and the doubt whether his work would not have been better if it could have been more steadily continuous. But if ever a man had a great object in life, and pursued it through good and evil report, through ardent hope and keen disappointment, to the end, with unwearied patience and unshaken faith, it was Bacon, when he sought the improvement of human knowledge "for the glory of God and the relief of man's estate." It is not the least part of the pathetic fortune of his life that his own success was so imperfect.

When a reader first comes from the vague, popular notions of Bacon's work to his definite proposals the effect is startling. Every one has heard that he contemplated a complete reform of the existing conceptions of human knowledge, and of the methods by which knowledge was to be sought; that

rejecting them as vitiated, by the loose and untested way in which they had been formed, he called men from verbal generalisations and unproved assumptions to come down face to face with the realities of experience; that he substituted for formal reasoning, from baseless premises and unmeaning principles, a methodical system of cautious and sifting inference from wide observation and experiment; and that he thus opened the path which modern science thenceforth followed, with its amazing and unexhausted discoveries, and its vast and beneficent practical results. We credit all this to Bacon, and assuredly not without reason. All this is what was embraced in his vision of a changed world of thought and achievement. All this is what was meant by that *Regnum Hominis*, which, with a play on sacred words which his age did not shrink from, and which he especially pleased himself with, marked the coming of that hitherto unimagined empire of man over the powers and forces which encompassed him. But the detail of all this is multifarious and complicated, and is not always what we expect; and when we come to see how his work is estimated by those who, by greatest familiarity with scientific ideas and the history of scientific inquiries, are best fitted to judge of it, many a surprise awaits us.

For we find that the greatest differences of opinion exist on the value of what he did. Not only very unfavourable judgments have been passed upon it, on general grounds — as an irreligious, or a shallow and one-sided, or a poor and "utilitarian" philosophy, and on a definite comparison of it with the actual methods and processes which as a matter of history have been the real means of scientific discovery — but also some of those who have most admired his genius, and with the deepest love and reverence have spared no pains to do it full justice, have yet come to the conclusion that as an instrument and real method of work Bacon's attempt was a failure. It is not only De Maistre and Lord Macaulay who dispute his philosophical eminence. It is not only the depreciating opinion of a contemporary like Harvey, who was actually doing what Bacon was writing about. It is not only that men who after the long history of modern science have won their place among its leaders, and are familiar by daily

experience with the ways in which it works — a chemist like Liebig, a physiologist like Claude Bernard — say that they can find nothing to help them in Bacon's methods. It is not only that a clear and exact critic like M. de Rémusat looks at his attempt, with its success and failure, as characteristic of English, massive, practical good sense rather than as marked by real philosophical depth and refinement, such as Continental thinkers point to and are proud of in Descartes and Leibnitz. It is not even that a competent master of the whole domain of knowledge, Whewell, filled with the deepest sense of all that the world owes to Bacon, takes for granted that "though Bacon's general maxims are sagacious and animating, his particular precepts failed in his hands, and are now practically useless;" and assuming that Bacon's method is not the right one, and not complete as far as the progress of science up to his time could direct it, proceeds to construct a *Novum Organum Renovatum*. But Bacon's writings have recently undergone the closest examination by two editors, whose care for his memory is as loyal and affectionate as their capacity is undoubted, and their willingness to take trouble boundless. And Mr. Ellis and Mr. Spedding, with all their interest in every detail of Bacon's work, and admiration of the way in which he performed it, make no secret of their conclusion that he failed in the very thing on which he was most bent — the discovery of practical and fruitful ways of scientific inquiry. "Bacon," says Mr. Spedding, "failed to devise a practicable method for the discovery of the Forms of Nature, because he misconceived the conditions of the case.... For the same reason he failed to make any single discovery which holds its place as one of the steps by which science has in any direction really advanced. The clew with which he entered the labyrinth did not reach far enough; before he had nearly attained his end he was obliged either to come back or to go on without it."

"His peculiar system of philosophy," says Mr. Spedding in another preface, "that is to say, the peculiar method of investigation, the "*organum*," the "*formula*," the "*clavis*," the "*ars ipsa interpretandi naturam*," the "*filum Labyrinthi*," or by whatever of its many names we choose to call that artificial process by which alone he believed man could attain a knowledge of the laws

and a command over the powers of nature — *of this philosophy we can make nothing*. If we have not tried it, it is because we feel confident that it would not answer. We regard it as a curious piece of machinery, very subtle, elaborate, and ingenious, but not worth constructing, because all the work it could do may be done more easily another way." — *Works*, iii. 171.

What his method really was is itself a matter of question. Mr. Ellis speaks of it as a matter "but imperfectly apprehended." He differs from his fellow-labourer Mr. Spedding, in what he supposes to be its central and characteristic innovation. Mr. Ellis finds it in an improvement and perfection of logical machinery. Mr. Spedding finds it in the formation of a great "natural and experimental history," a vast collection of facts in every department of nature, which was to be a more important part of his philosophy than the *Novum Organum* itself. Both of them think that as he went on, the difficulties of the work grew upon him, and caused alterations in his plans, and we are reminded that "there is no didactic exposition of his method in the whole of his writings," and that "this has not been sufficiently remarked by those who have spoken of his philosophy."

In the first place, the kind of intellectual instrument which he proposed to construct was a mistake. His great object was to place the human mind "on a level with things and nature" (*ut faciamus intellectum humanum rebus et naturæ parem*), and this could only be done by a revolution in methods. The ancients had all that genius could do for man; but it was a matter, he said, not of the strength and fleetness of the running, but of the rightness of the way. It was a new method, absolutely different from anything known, which he proposed to the world, and which should lead men to knowledge, with the certainty and with the impartial facility of a high-road. The Induction which he imagined to himself as the contrast to all that had yet been tried was to have two qualities. It was to end, by no very prolonged or difficult processes, in absolute certainty. And next, it was to leave very little to the differences of intellectual power: it was to level minds and capacities. It was to give all men the same sort of power which a pair of compasses gives the hand in drawing a circle. "*Absolute certainty, and a mechanical mode of procedure*" says Mr. Ellis, "*such that all men should be*

capable of employing it, are the two great features of the Baconian system." This he thought possible, and this he set himself to expound— "a method universally applicable, and in all cases infallible." In this he saw the novelty and the vast importance of his discovery. "By this method all the knowledge which the human mind was capable of receiving might be attained, and attained without unnecessary labour." It was a method of "a demonstrative character, with the power of reducing all minds to nearly the same level." The conception, indeed, of a "great Art of knowledge," of an "Instauration" of the sciences, of a "Clavis" which should unlock the difficulties which had hindered discovery, was not a new one. This attempt at a method which should be certain, which should level capacities, which should do its work in a short time, had a special attraction for the imagination of the wild spirits of the South, from Raimond Lulli in the thirteenth century to the audacious Calabrians of the sixteenth. With Bacon it was something much more serious and reasonable and business-like. But such a claim has never yet been verified; there is no reason to think that it ever can be; and to have made it shows a fundamental defect in Bacon's conception of the possibilities of the human mind and the field it has to work in.

In the next place, though the prominence which he gave to the doctrine of Induction was one of those novelties which are so obvious after the event, though so strange before it, and was undoubtedly the element in his system which gave it life and power and influence on the course of human thought and discovery, his account of Induction was far from complete and satisfactory. Without troubling himself about the theory of Induction, as De Rémusat has pointed out, he contented himself with applying to its use the precepts of common-sense and a sagacious perception of the circumstances in which it was to be employed. But even these precepts, notable as they were, wanted distinctness, and the qualities needed for working rules. The change is great when in fifty years we pass from the poetical science of Bacon to the mathematical and precise science of Newton. His own time may well have been struck by the originality and comprehensiveness of such a discriminating arrangement of proofs as the "Prerogative Instances" of the *Novum Organum*, so

natural and real, yet never before thus compared and systematized. But there is a great interval between his method of experimenting, his "*Hunt of Pan*" — the three tables of Instances, "*Presence*," "*Absence*" and "*Degrees, or Comparisons*," leading to a process of sifting and exclusion, and to the *First Vintage*, or beginnings of theory — and say, for instance, Mill's four methods of experimental inquiry: the method of *agreement*, of *differences*, of *residues*, and of *concomitant variations*. The course which he marked out so laboriously and so ingeniously for Induction to follow was one which was found to be impracticable, and as barren of results as those deductive philosophies on which he lavished his scorn. He has left precepts and examples of what he meant by his cross-examining and sifting processes. As admonitions to cross-examine and to sift facts and phenomena they are valuable. Many of the observations and classifications are subtle and instructive. But in his hands nothing comes of them. They lead at the utmost to mere negative conclusions; they show what a thing is not. But his attempt to elicit anything positive out of them breaks down, or ends at best in divinations and guesses, sometimes — as in connecting Heat and Motion — very near to later and more carefully-grounded theories, but always unverified. He had a radically false and mechanical conception, though in words he earnestly disclaims it, of the way to deal with the facts of nature. He looked on them as things which told their own story, and suggested the questions which ought to be put to them; and with this idea half his time was spent in collecting huge masses of indigested facts of the most various authenticity and value, and he thought he was collecting materials which his method had only to touch in order to bring forth from them light and truth and power. He thought that, not in certain sciences, but in all, one set of men could do the observing and collecting, and another be set on the work of Induction and the discovery of "axioms." Doubtless in the arrangement and sorting of them his versatile and ingenious mind gave itself full play; he divides and distinguishes them into their companies and groups, different kinds of Motion, "Prerogative" instances, with their long tale of imaginative titles. But we look in vain for any use that he was able to make of them, or even to suggest. Bacon never adequately realised that

no promiscuous assemblage of even the most certain facts could ever lead to knowledge, could ever suggest their own interpretation, without the action on them of the living mind, without the initiative of an idea. In truth he was so afraid of assumptions and "anticipations" and prejudices — his great bugbear was so much the "*intellectus sibi permissus*" the mind given liberty to guess and imagine and theorise, instead of, as it ought, absolutely and servilely submitting itself to the control of facts — that he missed the true place of the rational and formative element in his account of Induction. He does tell us, indeed, that "truth emerges sooner from error than from confusion." He indulges the mind, in the course of its investigation of "Instances," with a first "vintage" of provisional generalisations. But of the way in which the living mind of the discoverer works, with its ideas and insight, and thoughts that come no one knows whence, working hand in hand with what comes before the eye or is tested by the instrument, he gives us no picture. Compare his elaborate investigation of the "Form of Heat" in the *Novum Organum*, with such a record of real inquiry as Wells's *Treatise on Dew*, or Herschel's analysis of it in his *Introduction to Natural Philosophy*. And of the difference of genius between a Faraday or a Newton, and the crowd of average men who have used and finished off their work, he takes no account. Indeed, he thinks that for the future such difference is to disappear.

"That his method is impracticable," says Mr. Ellis, "cannot, I think, be denied, if we reflect not only that it never has produced any result, but also that the process by which scientific truths have been established cannot be so presented as even to appear to be in accordance with it. In all cases this process involves an element to which nothing corresponds in the Tables of 'Comparence' and 'Exclusion,' namely, the application to the facts of observation of a principle of arrangement, an idea, existing in the mind of the discoverer antecedently to the act of induction. It may be said that this idea is precisely one of the *naturæ* into which the facts of observation ought in Bacon's system to be analysed. And this is in one sense true; but it must be added that this analysis, if it be thought right so to call it, is of the essence of the discovery

which results from it. In most cases the act of induction follows as a matter of course as soon as the appropriate idea has been introduced." — Ellis, *General Preface*, i. 38.

Lastly, not only was Bacon's conception of philosophy so narrow as to exclude one of its greatest domains; for, says Mr. Ellis, "it cannot be denied that to Bacon all sound philosophy seemed to be included in what we now call the natural sciences," and in all its parts was claimed as the subject of his inductive method; but Bacon's scientific knowledge and scientific conceptions were often very imperfect — more imperfect than they ought to have been for his time. Of one large part of science, which was just then beginning to be cultivated with high promise of success — the knowledge of the heavens — he speaks with a coldness and suspicion which contrasts remarkably with his eagerness about things belonging to the sphere of the earth and within reach of the senses. He holds, of course, the unity of the world; the laws of the whole visible universe are one order; but the heavens, wonderful as they are to him, are — compared with other things — out of his track of inquiry. He had his astronomical theories; he expounded them in his "*Descriptio Globi Intellectualis*" and his *Thema Coeli* He was not altogether ignorant of what was going on in days when Copernicus, Kepler, and Galileo were at work. But he did not know how to deal with it, and there were men in England, before and then, who understood much better than he the problems and the methods of astronomy. He had one conspicuous and strange defect for a man who undertook what he did. He was not a mathematician: he did not see the indispensable necessity of mathematics in the great *Instauration* which he projected; he did not much believe in what they could do. He cared so little about them that he takes no notice of Napier's invention of Logarithms. He was not able to trace how the direct information of the senses might be rightly subordinated to the rational, but not self-evident results of geometry and arithmetic. He was impatient of the subtleties of astronomical calculations; they only attempted to satisfy problems about the motion of bodies in the sky, and told us nothing of physical fact; they gave us, as Prometheus gave to Jove, the outside skin of the offering, which was stuffed

inside with straw and rubbish. He entirely failed to see that before dealing with physical astronomy, it must be dealt with mathematically. “It is well to remark,” as Mr. Ellis says, “that none of Newton’s astronomical discoveries could have been made if astronomers had not continued to render themselves liable to Bacon’s censure.” Bacon little thought that in navigation the compass itself would become a subordinate instrument compared with the helps given by mathematical astronomy. In this, and in other ways, Bacon rose above his time in his conceptions of what *might be*, but not of what *was*; the list is a long one, as given by Mr. Spedding (iii. 511), of the instances which show that he was ill-informed about the advances of knowledge in his own time. And his mind was often not clear when he came to deal with complex phenomena. Thus, though he constructed a table of specific gravities— “the only collection,” says Mr. Ellis, “of quantitative experiments that we find in his works,” and “wonderfully accurate considering the manner in which they were obtained;” yet he failed to understand the real nature of the famous experiment of Archimedes. And so with the larger features of his teaching it is impossible not to feel how imperfectly he had emancipated himself from the power of words and of common prepossessions; how for one reason or another he had failed to call himself to account in the terms he employed, and the assumptions on which he argued. The caution does not seem to have occurred to him that the statement of a fact may, in nine cases out of ten, involve a theory. His whole doctrine of “Forms” and “Simple natures,” which is so prominent in his method of investigation, is an example of loose and slovenly use of unexamined and untested ideas. He allowed himself to think that it would be possible to arrive at an alphabet of nature, which, once attained, would suffice to spell out and constitute all its infinite combinations. He accepted, without thinking it worth a doubt, the doctrine of appetites and passions and inclinations and dislikes and horrors in inorganic nature. His whole physiology of life and death depends on a doctrine of animal spirits, of which he traces the operations and qualities as if they were as certain as the nerves or the blood, and of which he gives this account— “that in every tangible body there is a spirit covered and enveloped in the grosser

body;" "not a virtue, not an energy, not an actuality, nor any such idle matter, but a body thin and invisible, and yet having place and dimension, and real." ... "a middle nature between flame, which is momentary, and air which is permanent." Yet these are the very things for which he holds up Aristotle and the Scholastics and the Italian speculators to reprobation and scorn. The clearness of his thinking was often overlaid by the immense profusion of decorative material which his meditation brought along with it. The defect was greater than that which even his ablest defenders admit. It was more than that in that "greatest and radical difference, which he himself observes" between minds, the difference between minds which were apt to note *distinctions*, and those which were apt to note *likenesses*, he was, without knowing it, defective in the first. It was that in many instances he exemplified in his own work the very faults which he charged on the older philosophies: haste, carelessness, precipitancy, using words without thinking them out, assuming to know when he ought to have perceived his real ignorance.

What, then, with all these mistakes and failures, not always creditable or pardonable, has given Bacon his preeminent place in the history of science?

1. The answer is that with all his mistakes and failures, the principles on which his mode of attaining a knowledge of nature was based were the only true ones; and they had never before been propounded so systematically, so fully, and so earnestly. His was not the first mind on whom these principles had broken. Men were, and had been for some time, pursuing their inquiries into various departments of nature precisely on the general plan of careful and honest observation of real things which he enjoined. They had seen, as he saw, the futility of all attempts at natural philosophy by mere thinking and arguing, without coming into contact with the contradictions or corrections or verifications of experience. In Italy, in Germany, in England there were laborious and successful workers, who had long felt that to be in touch with nature was the only way to know. But no one had yet come before the world to proclaim this on the house-tops, as the key of the only certain path to the secrets of nature, the watchword of a revolution in the methods of interpreting her; and

this Bacon did with an imposing authority and power which enforced attention. He spoke the thoughts of patient toilers like Harvey with a largeness and richness which they could not command, and which they perhaps smiled at. He disentangled and spoke the vague thoughts of his age, which other men had not the courage and clearness of mind to formulate. What Bacon *did*, indeed, and what he *meant*, are separate matters. He *meant* an infallible method by which man should be fully equipped for a struggle with nature; he meant an irresistible and immediate conquest, within a definite and not distant time. It was too much. He himself saw no more of what he *meant* than Columbus did of America. But what he *did* was to persuade men for the future that the intelligent, patient, persevering cross-examination of things, and the thoughts about them, was the only, and was the successful road to know. No one had yet done this, and he did it. His writings were a public recognition of real science, in its humblest tasks about the commonplace facts before our feet, as well as in its loftiest achievements. "The man who is growing great and happy by electrifying a bottle," says Dr. Johnson, "wonders to see the world engaged in the prattle about peace and war," and the world was ready to smile at the simplicity or the impertinence of his enthusiasm. Bacon impressed upon the world for good, with every resource of subtle observation and forcible statement, that "the man who is growing great by electrifying a bottle" is as important a person in the world's affairs as the arbiter of peace and war.

2. Yet this is not all. An inferior man might have made himself the mouthpiece of the hopes and aspirations of his generation after a larger science. But to Bacon these aspirations embodied themselves in the form of a great and absorbing idea; an idea which took possession of the whole man, kindling in him a faith which nothing could quench, and a passion which nothing could dull; an idea which, for forty years, was his daily companion, his daily delight, his daily business; an idea which he was never tired of placing in ever fresh and more attractive lights, from which no trouble could wean him, about which no disaster could make him despair; an idea round which the instincts and intuitions and obstinate convictions of genius gathered, which kindled his rich imagination and

was invested by it with a splendour and magnificence like the dreams of fable. It is this idea which finds its fitting expression in the grand and stately aphorisms of the *Novum Organum*, in the varied fields of interest in the *De Augmentis*, in the romance of the *New Atlantis*. It is this idea, this certainty of a new unexplored Kingdom of Knowledge within the reach and grasp of man, if he will be humble enough and patient enough and truthful enough to occupy it — this announcement not only of a new system of thought, but of a change in the condition of the world — a prize and possession such as man had not yet imagined; this belief in the fortunes of the human race and its issue, "such an issue, it may be, as in the present condition of things and men's minds cannot easily be conceived or imagined," yet more than verified in the wonders which our eyes have seen — it is this which gives its prerogative to Bacon's work. That he bungled about the processes of Induction, that he talked about an unintelligible doctrine of *Forms*, did not affect the weight and solemnity of his call to learn, so full of wisdom and good-sense, so sober and so solid, yet so audaciously confident. There had been nothing like it in its ardour of hope, in the glory which it threw around the investigation of nature. It was the presence and the power of a great idea — long become a commonplace to us, but strange and perplexing at first to his own generation, which probably shared Coke's opinion that it qualified its champion for a place in the company of the "Ship of Fools," which expressed its opinion of the man who wrote the *Novum Organum*, in the sentiment that "a fool *could* not have written it, and a wise man *would* not" — it is this which has placed Bacon among the great discoverers of the human race.

It is this imaginative yet serious assertion of the vast range and possibilities of human knowledge which, as M. de Rémusat remarks — the keenest and fairest of Bacon's judges — gives Bacon his claim to the undefinable but very real character of greatness. Two men stand out, "the masters of those who know," without equals up to their time, among men — the Greek Aristotle and the Englishman Bacon. They agree in the universality and comprehensiveness of their conception of human knowledge; and they were absolutely alone in their serious practical ambition to work out this conception. In the separate

departments of thought, of investigation, of art, each is left far behind by numbers of men, who in these separate departments have gone far deeper than they, have soared higher, have been more successful in what they attempted. But Aristotle first, and for his time more successfully, and Bacon after him, ventured on the daring enterprise of "taking all knowledge for their province;" and in this they stood alone. This present scene of man's existence, this that we call nature, the stage on which mortal life begins and goes on and ends, the faculties with which man is equipped to act, to enjoy, to create, to hold his way amid or against the circumstances and forces round him — this is what each wants to know, as thoroughly and really as can be. It is not to reduce things to a theory or a system that they look around them on the place where they find themselves with life and thought and power; that were easily done, and has been done over and over again, only to prove its futility. It is to know, as to the whole and its parts, as men understand *knowing* in some one subject of successful handling, whether art or science or practical craft. This idea, this effort, distinguishes these two men. The Greeks — predecessors, contemporaries, successors of Aristotle — were speculators, full of clever and ingenious guesses, in which the amount of clear and certain fact was in lamentable disproportion to the schemes blown up from it; or they devoted themselves more profitably to some one or two subjects of inquiry, moral or purely intellectual, with absolute indifference to what might be asked, or what might be known, of the real conditions under which they were passing their existence. Some of the Romans, Cicero and Pliny, had encyclopædic minds; but the Roman mind was the slave of precedent, and was more than satisfied with partially understanding and neatly arranging what the Greeks had left. The Arabians looked more widely about them; but the Arabians were essentially sceptics, and resigned subjects to the inevitable and the inexplicable; there was an irony, open or covert, in their philosophy, their terminology, their transcendental mysticism, which showed how little they believed that they really knew. The vast and mighty intellects of the schoolmen never came into a real grapple with the immensity of the facts of the natural or even of the moral world; within the world of abstract thought, the world of

language, with its infinite growths and consequences, they have never had their match for keenness, for patience, for courage, for inexhaustible toil; but they were as much disconnected from the natural world, which was their stage of life, as if they had been disembodied spirits. The Renaissance brought with it not only the desire to know, but to know comprehensively and in all possible directions; it brought with it temptations to the awakened Italian genius, renewed, enlarged, refined, if not strengthened by its passage through the Middle Ages, to make thought deal with the real, and to understand the scene in which men were doing such strange and wonderful things; but Giordano Bruno, Telesio, Campanella, and their fellows, were not men capable of more than short flights, though they might be daring and eager ones. It required more thoroughness, more humble-minded industry, to match the magnitude of the task. And there have been men of universal minds and comprehensive knowledge since Bacon, Leibnitz, Goethe, Humboldt, men whose thoughts were at home everywhere, where there was something to be known. But even for them the world of knowledge has grown too large. We shall never again see an Aristotle or a Bacon, because the conditions of knowledge have altered. Bacon, like Aristotle, belonged to an age of adventure, which went to sea little knowing whither it went, and ill furnished with knowledge and instruments. He entered with a vast and vague scheme of discovery on these unknown seas and new worlds which to us are familiar, and daily traversed in every direction. This new world of knowledge has turned out in many ways very different from what Aristotle or Bacon supposed, and has been conquered by implements and weapons very different in precision and power from what they purposed to rely on. But the combination of patient and careful industry, with the courage and divination of genius, in doing what none had done before, makes it equally stupid and idle to impeach their greatness.

3. Bacon has been charged with bringing philosophy down from the heights, not as of old to make men know themselves, and to be the teacher of the highest form of truth, but to be the purveyor of material utility. It contemplates only, it is said, the "*commoda vitæ*;" about the deeper and more elevating problems of

thought it does not trouble itself. It concerns itself only about external and sensible nature, about what is "of the earth, earthy." But when it comes to the questions which have attracted the keenest and hardiest thinkers, the question, what it is that thinks and wills — what is the origin and guarantee of the faculties by which men know anything at all and form rational and true conceptions about nature and themselves, whence it is that reason draws its powers and materials and rules — what is the meaning of words which all use but few can explain — Time and Space, and Being and Cause, and consciousness and choice, and the moral law — Bacon is content with a loose and superficial treatment of them. Bacon certainly was not a metaphysician, nor an exact and lucid reasoner. With wonderful flashes of sure intuition or happy anticipation, his mind was deficient in the powers which deal with the deeper problems of thought, just as it was deficient in the mathematical faculty. The subtlety, the intuition, the penetration, the severe precision, even the force of imagination, which make a man a great thinker on any abstract subject were not his; the interest of questions which had interested metaphysicians had no interest for him: he distrusted and undervalued them. When he touches the "ultimities" of knowledge he is as obscure and hard to be understood as any of those restless Southern Italians of his own age, who shared with him the ambition of reconstructing science. Certainly the science which most interested Bacon, the science which he found, as he thought, in so desperate a condition, and to which he gave so great an impulse, was physical science. But physical science may be looked at and pursued in different ways, in different tempers, with different objects. It may be followed in the spirit of Newton, of Boyle, of Herschel, of Faraday; or with a confined and low horizon it may be dwarfed and shrivelled into a mean utilitarianism. But Bacon's horizon was not a narrow one. He believed in God and immortality and the Christian creed and hope. To him the restoration of the Reign of Man was a noble enterprise, because man was so great and belonged to so great an order of things, because the things which he was bid to search into with honesty and truthfulness were the works and laws of God, because it was so shameful and so miserable that from an ignorance which industry and good-sense could remedy, the tribes

of mankind passed their days in self-imposed darkness and helplessness. It was God's appointment that men should go through this earthly stage of their being. Each stage of man's mysterious existence had to be dealt with, not according to his own fancies, but according to the conditions imposed on it; and it was one of man's first duties to arrange for his stay on earth according to the real laws which he could find out if he only sought for them. Doubtless it was one of Bacon's highest hopes that from the growth of true knowledge would follow in surprising ways the relief of man's estate; this, as an end, runs through all his yearning after a fuller and surer method of interpreting nature. The desire to be a great benefactor, the spirit of sympathy and pity for mankind, reign through this portion of his work — pity for confidence so greatly abused by the teachers of man, pity for ignorance which might be dispelled, pity for pain and misery which might be relieved. In the quaint but beautiful picture of courtesy, kindness, and wisdom, which he imagines in the *New Atlantis*, the representative of true philosophy, the "Father of Solomon's House," is introduced as one who "had an aspect as if he pitied men." But unless it is utilitarianism to be keenly alive to the needs and pains of life, and to be eager and busy to lighten and assuage them, Bacon's philosophy was not utilitarian. It may deserve many reproaches, but not this one. Such a passage as the following — in which are combined the highest motives and graces and passions of the soul, love of truth, humility of mind, purity of purpose, reverence for God, sympathy for man, compassion for the sorrows of the world and longing to heal them, depth of conviction and faith — fairly represents the spirit which runs through his works. After urging the mistaken use of imagination and authority in science, he goes on — "There is not and never will be an end or limit to this; one catches at one thing, another at another; each has his favourite fancy; pure and open light there is none; every one philosophises out of the cells of his own imagination, as out of Plato's cave; the higher wits with more acuteness and felicity, the duller, less happily, but with equal pertinacity. And now of late, by the regulation of some learned and (as things now are) excellent men (the former license having, I suppose, become wearisome), the sciences are confined to certain and prescribed

authors, and thus restrained are imposed upon the old and instilled into the young; so that now (to use the sarcasm of Cicero concerning Cæsar's year) the constellation of Lyra rises by edict, and authority is taken for truth, not truth for authority. Which kind of institution and discipline is excellent for present use, but precludes all prospect of improvement. For we copy the sin of our first parents while we suffer for it. They wished to be like God, but their posterity wish to be even greater. For we create worlds, we direct and domineer over nature, we will have it that all things *are* as in our folly we think they should be, not as seems fittest to the Divine wisdom, or as they are found to be in fact; and I know not whether we more distort the facts of nature or of our own wits; but we clearly impress the stamp of our own image on the creatures and works of God, instead of carefully examining and recognising in them the stamp of the Creator himself. Wherefore our dominion over creatures is a second time forfeited, not undeservedly; and whereas after the fall of man some power over the resistance of creatures was still left to him — the power of subduing and managing them by true and solid arts — yet this too through our insolence, and because we desire to be like God and to follow the dictates of our own reason, we in great part lose. If, therefore, there be any humility towards the Creator, any reverence for or disposition to magnify His works, any charity for man and anxiety to relieve his sorrows and necessities, any love of truth in nature, any hatred of darkness, any desire for the purification of the understanding, we must entreat men again and again to discard, or at least set apart for a while, these volatile and preposterous philosophies which have preferred theses to hypotheses, led experience captive, and triumphed over the works of God; and to approach with humility and veneration to unroll the volume of Creation, to linger and meditate therein, and with minds washed clean from opinions to study it in purity and integrity. For this is that sound and language which "went forth into all lands," and did not incur the confusion of Babel; this should men study to be perfect in, and becoming again as little children condescend to take the alphabet of it into their hands, and spare no pains to search and unravel the interpretation thereof,

but pursue it strenuously and persevere even unto death." — Preface to *Historia Naturalis*: translated, *Works*, v. 132-3.

CHAPTER IX.

BACON AS A WRITER.

Bacon's name belongs to letters as well as to philosophy. In his own day, whatever his contemporaries thought of his *Instauration of Knowledge*, he was in the first rank as a speaker and a writer. Sir Walter Raleigh, contrasting him with Salisbury, who could speak but not write, and Northampton, who could write but not speak, thought Bacon eminent both as a speaker and a writer. Ben Jonson, passing in review the more famous names of his own and the preceding age, from Sir Thomas More to Sir Philip Sidney, Hooker, Essex, and Raleigh, places Bacon without a rival at the head of the company as the man who had "fulfilled all numbers," and "stood as the mark and ἀκμὴ of our language." And he also records Bacon's power as a speaker. "No man," he says, "ever spoke more neatly, more pressly, or suffered less emptiness, less idleness, in what he uttered."..."His hearers could not cough or look aside from him without loss. He commanded when he spoke, and had his judges angry and pleased at his devotion ... the fear of every man that heard him was that he should make an end." He notices one feature for which we are less prepared, though we know that the edge of Bacon's sarcastic tongue was felt and resented in James's Court. "His speech," says Ben Jonson, "was nobly censorious when he could *spare and pass by a jest*." The unpopularity which certainly seems to have gathered round his name may have had something to do with this reputation.

Yet as an English writer Bacon did not expect to be remembered, and he hardly cared to be. He wrote much in Latin, and his first care was to have his books put into a Latin dress. "For these modern languages," he wrote to Toby Matthews towards the close of his life, "will at one time or another play the bank-rowte with books, and since I have lost much time with this age, I would be glad if God would give me leave to recover it with posterity." He wanted to be read by the learned out of England, who were supposed to appreciate his

philosophical ideas better than his own countrymen, and the only way to this was to have his books translated into the "general language." He sends Prince Charles the *Advancement* in its new Latin dress. "It is a book," he says, "that will live, and be a citizen of the world, as English books are not." And he fitted it for continental reading by carefully weeding it of all passages that might give offence to the censors at Rome or Paris. "I have been," he writes to the King, "mine own *Index Expurgatorius*, that it may be read in all places. For since my end of putting it in Latin was to have it read everywhere, it had been an absurd contradiction to free it in the language and to pen it up in the matter." Even the *Essays* and the *History of Henry VII.* he had put into Latin "by some good pens that do not forsake me." Among these translators are said to have been George Herbert and Hobbes, and on more doubtful authority, Ben Jonson and Selden. The *Essays* were also translated into Latin and Italian with Bacon's sanction.

Bacon's contemptuous and hopeless estimate of "these modern languages," forty years after Spenser had proclaimed and justified his faith in his own language, is only one of the proofs of the short-sightedness of the wisest and the limitations of the largest-minded. Perhaps we ought not to wonder at his silence about Shakespeare. It was the fashion, except among a set of clever but not always very reputable people, to think the stage, as it was, below the notice of scholars and statesmen; and Shakespeare took no trouble to save his works from neglect. Yet it is a curious defect in Bacon that he should not have been more alive to the powers and future of his own language. He early and all along was profoundly impressed with the contrast, which the scholarship of the age so abundantly presented, of words to things. He dwells in the *Advancement* on that "first distemper of learning, when men study words and not matter." He illustrates it at large from the reaction of the new learning and of the popular teaching of the Reformation against the utilitarian and unclassical terminology of the schoolmen; a reaction which soon grew to excess, and made men "hunt more after choiceness of the phrase, and the round and clean composition of the sentence, and the sweet falling of the clauses," than after worth of subject, soundness of argument, "life of invention or depth of judgment." "I have

represented this," he says, "in an example of late times, but it hath been and will be *secundum majus et minus* in all times;" and he likens this "vanity" to "Pygmalion's frenzy"— "for to fall in love with words which are but the images of matter, is all one as to fall in love with a picture." He was dissatisfied with the first attempt at translation into Latin of the *Advancement* by Dr. Playfer of Cambridge, because he "desired not so much neat and polite, as clear, masculine, and apt expression." Yet, with this hatred of circumlocution and prettiness, of the cloudy amplifications, and pompous flourishings, and "the flowing and watery vein," which the scholars of his time affected, it is strange that he should not have seen that the new ideas and widening thoughts of which he was the herald would want a much more elastic and more freely-working instrument than Latin could ever become. It is wonderful indeed what can be done with Latin. It was long after his day to be the language of the exact sciences. In his *History of the Winds*, which is full of his irrepressible fancy and picturesqueness, Bacon describes in clear and intelligible Latin the details of the rigging of a modern man-of-war, and the mode of sailing her. But such tasks impose a yoke, sometimes a rough one, on a language which has "taken its ply" in very different conditions, and of which the genius is that of indirect and circuitous expression, "full of majesty and circumstance." But it never, even in those days of scholarship, could lend itself to the frankness, the straightforwardness, the fulness and shades of suggestion and association, with which, in handling ideas of subtlety and difficulty, a writer would wish to speak to his reader, and which he could find only in his mother tongue. It might have been thought that with Bacon's contempt of form and ceremony in these matters, his consciousness of the powers of English in his hands might have led him to anticipate that a flexible and rich and strong language might create a literature, and that a literature, if worth studying, would be studied in its own language. But so great a change was beyond even his daring thoughts. To him, as to his age, the only safe language was the Latin. For familiar use English was well enough. But it could not be trusted; "it would play the bankrupt with books." And yet Galileo was writing in Italian as well as in Latin; only within twenty-five years later,

Descartes was writing *De la Méthode*, and Pascal was writing in the same French in which he wrote the *Provincial Letters*, his *Nouvelles Expériences touchant le Vide*, and the controversial pamphlets which followed it; showing how in that interval of five-and-twenty years an instrument had been fashioned out of a modern language such as for lucid expression and clear reasoning, Bacon had not yet dreamed of. From Bacon to Pascal is the change from the old scientific way of writing to the modern; from a modern language, as learned and used in the 16th century, to one learned in the 17th.

But the language of the age of Elizabeth was a rich and noble one, and it reached a high point in the hands of Bacon. In his hands it lent itself to many uses, and assumed many forms, and he valued it, not because he thought highly of its qualities as a language, but because it enabled him with least trouble "to speak as he would," in throwing off the abundant thoughts that rose within his mind, and in going through the variety of business which could not be done in Latin. But in all his writing it is the matter, the real thing that he wanted to say, which was uppermost. He cared how it was said, not for the sake of form or ornament, but because the force and clearness of what was said depended so much on how it was said. Of course, what he wanted to say varied indefinitely with the various occasions of his life. His business may merely be to write "a device" or panegyric for a pageant in the Queen's honour, or for the revels of Gray's Inn. But even these trifles are the result of real thought, and are full of ideas — ideas about the hopes of knowledge or about the policy of the State; and though, of course, they have plenty of the flourishes and quaint absurdities indispensable on such occasions, yet the "rhetorical affectation" is in the thing itself, and not in the way it is handled; he had an opportunity of saying some of the things which were to him of deep and perpetual interest, and he used it to say them, as forcibly, as strikingly, as attractively as he could. His manner of writing depends, not on a style, or a studied or acquired habit, but on the nature of the task which he has in hand. Everywhere his matter is close to his words, and governs, animates, informs his words. No one in England before had so much as he had the power to say what he wanted to say, and exactly as he wanted to say

it. No one was so little at the mercy of conventional language or customary rhetoric, except when he persuaded himself that he had to submit to those necessities of flattery, which cost him at last so dear.

The book by which English readers, from his own time to ours, have known him best, better than by the originality and the eloquence of the *Advancement*, or than by the political weight and historical imagination of the *History of Henry VII.*, is the first book which he published, the volume of *Essays*. It is an instance of his self-willed but most skilful use of the freedom and ease which the "modern language," which he despised, gave him. It is obvious that he might have expanded these "Counsels, moral and political," to the size which such essays used to swell to after his time. Many people would have thanked him for doing so; and some have thought it a good book on which to hang their own reflections and illustrations. But he saw how much could be done by leaving the beaten track of set treatise and discourse, and setting down unceremoniously the observations which he had made, and the real rules which he had felt to be true, on various practical matters which come home to men's "business and bosoms." He was very fond of these moral and political generalisations, both of his own collecting and as found in writers who, he thought, had the right to make them, like the Latins of the Empire and the Italians and Spaniards of the Renaissance. But a mere string of maxims and quotations would have been a poor thing and not new; and he cast what he had to say into connected wholes. But nothing can be more loose than the structure of the essays. There is no art, no style, almost, except in a few — the political ones — no order: thoughts are put down and left unsupported, unproved, undeveloped. In the first form of the ten, which composed the first edition of 1597, they are more like notes of analysis or tables of contents; they are austere even to meagreness. But the general character continues in the enlarged and expanded ones of Bacon's later years. They are like chapters in Aristotle's Ethics and Rhetoric on virtues and characters; only Bacon's takes Aristotle's broad marking lines as drawn, and proceeds with the subtler and more refined observations of a much longer and wider experience. But these short papers say what they have to say without preface, and in literary

undress, without a superfluous word, without the joints and bands of structure; they say it in brief, rapid sentences, which come down, sentence after sentence, like the strokes of a great hammer. No wonder that in their disdainful brevity they seem rugged and abrupt, "and do not seem to end, but fall." But with their truth and piercingness and delicacy of observation, their roughness gives a kind of flavour which no elaboration could give. It is none the less that their wisdom is of a somewhat cynical kind, fully alive to the slipperiness and self-deceits and faithlessness which are in the world and rather inclined to be amused at them. In some we can see distinct records of the writer's own experience: one contains the substance of a charge delivered to Judge Hutton on his appointment; another of them is a sketch drawn from life of a character which had crossed Bacon's path, and in the essay on *Seeming Wise* we can trace from the impatient notes put down in his *Commentarius Solutus*, the picture of the man who stood in his way, the Attorney-General Hobart. Some of them are memorable oracular utterances not inadequate to the subject, on *Truth* or *Death* or *Unity*. Others reveal an utter incapacity to come near a subject, except as a strange external phenomena, like the essay on *Love*. There is a distinct tendency in them to the Italian school of political and moral wisdom, the wisdom of distrust and of reliance on indirect and roundabout ways. There is a group of them, "of *Delays*," "of *Cunning*," "of *Wisdom for a Man's Self*," "of *Despatch*," which show how vigilantly and to what purpose he had watched the treasurers and secretaries and intriguers of Elizabeth's and James's Courts; and there are curious self-revelations, as in the essay on *Friendship*. But there are also currents of better and larger feeling, such as those which show his own ideal of "*Great Place*," and what he felt of its dangers and duties. And mixed with the fantastic taste and conceits of the time, there is evidence in them of Bacon's keen delight in nature, in the beauty and scents of flowers, in the charm of open-air life, as in the essay on *Gardens*, "The purest of human pleasures, the greatest refreshment to the spirits of man."

But he had another manner of writing for what he held to be his more serious work. In the philosophical and historical works there is no want of attention to the flow and order and ornament of composition. When we come to the

Advancement of Learning, we come to a book which is one of the landmarks of what high thought and rich imagination have made of the English language. It is the first great book in English prose of secular interest; the first book which can claim a place beside the *Laws of Ecclesiastical Polity*. As regards its subject-matter, it has been partly thrown into the shade by the greatly enlarged and elaborate form in which it ultimately appeared, in a Latin dress, as the first portion of the scheme of the *Instauratio*, the *De Augmentis Scientiarum*. Bacon looked on it as a first effort, a kind of call-bell to awaken and attract the interest of others in the thoughts and hopes which so interested himself. But it contains some of his finest writing. In the *Essays* he writes as a looker-on at the game of human affairs, who, according to his frequent illustration, sees more of it than the gamesters themselves, and is able to give wiser and faithful counsel, not without a touch of kindly irony at the mistakes which he observes. In the *Advancement* he is the enthusiast for a great cause and a great hope, and all that he has of passion and power is enlisted in the effort to advance it. The *Advancement* is far from being a perfect book. As a survey of the actual state of knowledge in his day, of its deficiencies, and what was wanted to supply them, it is not even up to the materials of the time. Even the improved *De Augmentis* is inadequate; and there is reason to think the *Advancement* was a hurried book, at least in the later part, and it is defective in arrangement and proportion of parts. Two of the great divisions of knowledge — history and poetry — are despatched in comparatively short chapters; while in the division on "Civil Knowledge," human knowledge as it respects society, he inserts a long essay, obviously complete in itself and clumsily thrust in here, on the ways of getting on in the world, the means by which a man may be "*Faber fortunæ suæ*" — the architect of his own success; too lively a picture to be pleasant of the arts with which he had become acquainted in the process of rising. The book, too, has the blemishes of its own time; its want of simplicity, its inevitable though very often amusing and curious pedantries. But the *Advancement* was the first of a long line of books which have attempted to teach English readers how to think of knowledge; to make it really and intelligently the interest, not of the school or the study or the

laboratory only, but of society at large. It was a book with a purpose, new then, but of which we have seen the fulfilment. He wanted to impress on his generation, as a very practical matter, all that knowledge might do in wise hands, all that knowledge had lost by the faults and errors of men and the misfortunes of time, all that knowledge might be pushed to in all directions by faithful and patient industry and well-planned methods for the elevation and benefit of man in his highest capacities as well as in his humblest. And he further sought to teach them *how* to know; to make them understand that difficult achievement of self-knowledge, to know *what it is* to know; to give the first attempted chart to guide them among the shallows and rocks and whirlpools which beset the course and action of thought and inquiry; to reveal to them the "idols" which unconsciously haunt the minds of the strongest as well as the weakest, and interpose their delusions when we are least aware— "the fallacies and false appearances inseparable from our nature and our condition of life." To induce men to believe not only that there was much to know that was not yet dreamed of, but that the way of knowing needed real and thorough improvement; that the knowing mind bore along with it all kinds of snares and disqualifications of which it is unconscious; and that it needed training quite as much as materials to work on, was the object of the *Advancement*. It was but a sketch; but it was a sketch so truly and forcibly drawn, that it made an impression which has never been weakened. To us its use and almost its interest is passed. But it is a book which we can never open without coming on some noble interpretation of the realities of nature or the mind; some unexpected discovery of that quick and keen eye which arrests us by its truth; some felicitous and unthought-of illustration, yet so natural as almost to be doomed to become a commonplace; some bright touch of his incorrigible imaginativeness, ever ready to force itself in amid the driest details of his argument.

The *Advancement* was only one shape out of many into which he cast his thoughts. Bacon was not easily satisfied with his work; even when he published he did so, not because he had brought his work to the desired point, but lest anything should happen to him and it should "perish." Easy and unstudied as his

writing seems, it was, as we have seen, the result of unintermitted trouble and varied modes of working. He was quite as much a talker as a writer, and beat out his thoughts into shape in talking. In the essay on *Friendship* he describes the process with a vividness which tells of his own experience — "But before you come to that [the faithful counsel that a man receiveth from his friend], certain it is that whosoever hath his mind fraught with many thoughts, his wits and understanding do clarify and break up in the communicating and discoursing with another. He tosseth his thoughts more easily; he marshalleth them more orderly; he seeth how they look when they are turned into words; finally, he waxeth wiser than himself, and that more by an hour's discourse than by a day's meditation. It was well said by Themistocles to the King of Persia, 'That speech was like cloth of arras opened and put abroad, whereby the imagery doth appear in figure; whereas in thought they lie in packs.' Neither is this second fruit of friendship, in opening the understanding, restrained only to such friends as are able to give a man counsel. (They are, indeed, best.) But even without that, a man learneth of himself, and bringeth his own thoughts to light, and whetteth his wits against a stone which itself cuts not. In a word, a man were better relate himself to a *statua* or a picture, than to suffer his thoughts to pass in smother."

Bacon, as has been said, was a great maker of notes and note-books: he was careful not of the thought only, but of the very words in which it presented itself; everything was collected that might turn out useful in his writing or speaking, down to alternative modes of beginning or connecting or ending a sentence. He watched over his intellectual appliances and resources much more strictly than over his money concerns. He never threw away and never forgot what could be turned to account. He was never afraid of repeating himself, if he thought he had something apt to say. He was never tired of recasting and rewriting, from a mere fragment or preface to a finished paper. He has favourite images, favourite maxims, favourite texts, which he cannot do without. "*Da Fidei quæ sunt Fidei*" comes in from his first book to his last. The illustrations which he gets from the myth of Scylla, from Atalanta's ball, from Borgia's saying about the French marking their lodgings with chalk, the saying that God takes delight, like the

“innocent play of children,” “to hide his works in order to have them found out,” and to have kings as “his playfellows in that game,” these, with many others, reappear, however varied the context, from the first to the last of his compositions. An edition of Bacon, with marginal references and parallel passages, would show a more persistent recurrence of characteristic illustrations and sentences than perhaps any other writer.

The *Advancement* was followed by attempts to give serious effect to its lesson. This was nearly all done in Latin. He did so, because in these works he spoke to a larger and, as he thought, more interested audience; the use of Latin marked the gravity of his subject as one that touched all mankind; and the majesty of Latin suited his taste and his thoughts. Bacon spoke, indeed, impressively on the necessity of entering into the realm of knowledge in the spirit of a little child. He dwelt on the paramount importance of beginning from the very bottom of the scale of fact, of understanding the commonplace things at our feet, so full of wonder and mystery and instruction, before venturing on theories. The sun is not polluted by shining on a dunghill, and no facts were too ignoble to be beneath the notice of the true student of nature. But his own genius was for the grandeur and pomp of general views. The practical details of experimental science were, except in partial instances, yet a great way off; and what there was, he either did not care about or really understand, and had no aptitude for handling. He knew enough to give reality to his argument; he knew, and insisted on it, that the labour of observation and experiment would have to be very heavy and quite indispensable. But his own business was with great principles and new truths; these were what had the real attraction for him; it was the magnificent thoughts and boundless hopes of the approaching “kingdom of man” which kindled his imagination and fired his ambition. “He writes philosophy,” said Harvey, who had come to his own great discovery through patient and obscure experiments on frogs and monkeys— “he writes philosophy like a Lord Chancellor.” And for this part of the work, the stateliness and dignity of the Latin corresponded to the proud claims which he made for his conception of the knowledge which was to be. English seemed to him too homely to express

the hopes of the world, too unstable to be trusted with them. Latin was the language of command and law. His Latin, without enslaving itself to Ciceronian types, and with a free infusion of barbarous but most convenient words from the vast and ingenious terminology of the schoolmen, is singularly forcible and expressive. It is almost always easy and clear; it can be vague and general, and it can be very precise where precision is wanted. It can, on occasion, be magnificent, and its gravity is continually enlivened by the play upon it, as upon a background, of his picturesque and unexpected fancies. The exposition of his philosophical principles was attempted in two forms. He began in English. He began, in the shape of a personal account, a statement of a series of conclusions to which his thinking had brought him, which he called the "Clue of the Labyrinth," *Filum Labyrinthi*. But he laid this aside unfinished, and rewrote and completed it in Latin, with the title *Cogitata et Visa*. It gains by being in Latin; as Mr. Spedding says, "it must certainly be reckoned among the most perfect of Bacon's productions." The personal form with each paragraph begins and ends. "*Franciscus Bacon sic cogitavit ... itaque visum est ei*" gives to it a special tone of serious conviction, and brings the interest of the subject more keenly to the reader. It has the same kind of personal interest, only more solemn and commanding, which there is in Descartes's *Discours de la Méthode*. In this form Bacon meant at first to publish. He sent it to his usual critics, Sir Thomas Bodley, Toby Matthews, and Bishop Andrewes. And he meant to follow it up with a practical exemplification of his method. But he changed his plan. He had more than once expressed his preference for the form of *aphorisms* over the argumentative and didactic continuity of a set discourse. He had, indeed, already twice begun a series of aphorisms on the true methods of interpreting nature, and directing the mind in the true path of knowledge, and had begun them with the same famous aphorism with which the *Novum Organum* opens. He now reverted to the form of the aphorism, and resolved to throw the materials of the *Cogitata et Visa* into this shape. The result is the *Novum Organum*. It contains, with large additions, the substance of the treatise, but broken up and rearranged in the new form of separate impersonal generalised observations. The points and assertions

and issues which, in a continuous discourse, careful readers mark and careless ones miss, are one by one picked out and brought separately to the light. It begins with brief, oracular, unproved maxims and propositions, and goes on gradually into larger developments and explanations. The aphorisms are meant to strike, to awaken questions, to disturb prejudices, to let in light into a nest of unsuspected intellectual confusions and self-misunderstandings, to be the mottoes and watchwords of many a laborious and difficult inquiry. They form a connected and ordered chain, though the ties between each link are not given. In this way Bacon put forth his proclamation of war on all that then called itself science; his announcement that the whole work of solid knowledge must be begun afresh, and by a new, and, as he thought, infallible method. On this work Bacon concentrated all his care. It was twelve years in hand, and twelve times underwent his revision. “In the first book especially,” says Mr. Ellis, “every word seems to have been carefully weighed; and it would be hard to omit or change anything without injuring the meaning which Bacon intended to convey.” Severe as it is, it is instinct with enthusiasm, sometimes with passion. The Latin in which it is written answers to it; it has the conciseness, the breadth, the lordliness of a great piece of philosophical legislation.

The world has agreed to date from Bacon the systematic reform of natural philosophy, the beginning of an intelligent attempt, which has been crowned by such signal success, to place the investigation of nature on a solid foundation. On purely scientific grounds his title to this great honour may require considerable qualification. What one thing, it is asked, would not have been discovered in the age of Galileo and Harvey, if Bacon had never written? What one scientific discovery can be traced to him, or to the observance of his peculiar rules? It was something, indeed, to have conceived, as clearly as he conceived it, the large and comprehensive idea of what natural knowledge must be, and must rest upon, even if he were not able to realise his idea, and were mistaken in his practical methods of reform. But great ideas and great principles need their adequate interpreter, their *vates sacer*, if they are to influence the history of mankind. This was what Bacon was to science, to that great change in the

thoughts and activity of men in relation to the world of nature around them: and this is his title to the great place assigned to him. He not only understood and felt what science might be, but he was able to make others — and it was no easy task beforehand, while the wonders of discovery were yet in the future — understand and feel it too. And he was able to do this because he was one of the most wonderful of thinkers and one of the greatest of writers. The disclosure, the interpretation, the development of that great intellectual revolution which was in the air, and which was practically carried forward in obscurity, day by day, by the fathers of modern astronomy and chemistry and physiology, had fallen to the task of a genius, second only to Shakespeare. He had the power to tell the story of what they were doing and were to do with a force of imaginative reason of which they were utterly incapable. He was able to justify their attempts and their hopes as they themselves could not. He was able to interest the world in the great prospects opening on it, but of which none but a few students had the key. The calculations of the astronomer, the investigations of the physician, were more or less a subject of talk, as curious or possibly useful employments. But that which bound them together in the unity of science, which gave them their meaning beyond themselves, which raised them to a higher level and gave them their real dignity among the pursuits of men, which forced all thinking men to see what new and unsuspected possibilities in the knowledge and in the condition of mankind were opened before them, was not Bacon's own attempts at science, not even his collections of facts and his rules of method, but that great idea of the reality and boundless worth of knowledge which Bacon's penetrating and sure intuition had discerned, and which had taken possession of his whole nature. The impulse which he gave to the progress of science came from his magnificent and varied exposition of this idea; from his series of grand and memorable generalisations on the habits and faults of the human mind — on the difficult and yet so obvious and so natural precautions necessary to guide it in the true and hopeful track. It came from the attractiveness, the enthusiasm, and the persuasiveness of the pleading; from the clear and forcible statements, the sustained eloquence, the generous hopes, the deep and earnest purpose of the

Advancement and the *De Augmentis*; from the nobleness, the originality, the picturesqueness, the impressive and irresistible truth of the great aphorisms of the *Novum Organum*.

THE END

ENDNOTES.

"*Auctori consilium*.

Instaurare paras veterum documenta sophorum: Instaura leges justitiamque prius."

He added, with allusion to the ship in the frontispiece of the *Novum Organum*, "It deserveth not to be read in schools, But to be freighted in the ship of Fools."

PREFACE.

Is there a mystery connected with the life of Francis Bacon? The average student of history or literature will unhesitatingly reply in the negative, perhaps qualifying his answer by adding: — Unless it be a mystery that a man with such magnificent intellectual attainments could have fallen so low as to prove a faithless friend to a generous benefactor in the hour of his trial, and, upon being raised to one of the highest positions of honour and influence in the State, to become a corrupt public servant and a receiver of bribes to pervert justice. — It is one of the most remarkable circumstances to be found in the history of any country that a man admittedly pre-eminent in his intellectual powers, spoken of by his contemporaries in the highest terms for his virtues and his goodness, should, in subsequent ages, be held up to obloquy and scorn and seldom be referred to except as an example of a corrupt judge, a standing warning to those who must take heed how they stand lest they fall. Truly the treatment which Francis Bacon has received confirms the truth of the aphorism, "The evil that men do lives after them; the good is oft interred with their bones."

It is not the intention in the following brief survey of Bacon's life to enter upon any attempt to vindicate his character. Since his works and life have come prominently before the reading public, he has never been without a defender. Montagu, Hepworth Dixon, and Spedding have, one after the other, raised their voices against the injustice which has been done to the memory of this great Englishman; and although Macaulay, in his misleading and inaccurate essay,[1] abounding in paradoxes and inconsistencies, produced the most powerful, though prejudiced, attack which has been made on Bacon's fame, he may almost be forgiven, because it provided the occasion for James Spedding in "Evenings with a Reviewer," to respond with a thorough and complete vindication of the man to whose memory he devoted his life. There rests on every member of the Anglo-Saxon race an obligation — imposed upon him by the benefits which he enjoys as the result of Francis Bacon's life-work — to read this vindication of

his character. Nor should mention be omitted of the essay by Mr. J. M. Robertson on “Francis Bacon” in his excellent work “Pioneer Humanists.” All these defenders of Bacon treat their subject from what may be termed the orthodox point of view. They follow in the beaten track. They do not look for Bacon outside his acknowledged works and letters. Since 1857, however, there has been steadily growing a belief that Bacon was associated with the literature of the Elizabethan and early Jacobean periods, and that he deliberately concealed his connection with it. That this view is scouted by what are termed the men of letters is well-known. They will have none of it. They refuse its claim to a rational hearing. But, in spite of this, as years go on, the number of adherents to the new theory steadily increases. The scornful epithets that are hurled at them only appear to whet their appetite, and increase their determination. Men and women devote their lives with enthusiasm to the quest for further knowledge. They dig and delve in the records of the period, and in the byeways of literature. Theories which appear extravagant and untenable are propounded. Whether any of these theories will come to be accepted and established beyond cavil, time alone can prove. But, at any rate, it is certain that in this quest many forgotten facts are brought to light, and the general stock of information as to the literature of the period is augmented.

In the following pages it is sought to establish what may be termed one of these extravagant theories. How far this attempt is successful, it is for the reader to judge. Notwithstanding all that may be said to the contrary, by far the greater part of Francis Bacon’s life is unknown. An attempt will be made by the aid of accredited documents and books to represent in a new light his youth and early manhood. It is contended that he deliberately sought to conceal his movements and work, although, at the same time, he left the landmarks by which a diligent student might follow them. In his youth he conceived the idea that the man Francis Bacon should be concealed, and be revealed only by his works. The motto, “*Mente videbor*” — by the mind I shall be seen — became the guiding principle of his life.

Chapter I. SOURCES OF INFORMATION.

The standard work is “The Life and Letters of Francis Bacon,” by James Spedding, which was published from 1858-1869. It comprises seven volumes, with 3,033 pages. The first twenty years of Bacon’s life are disposed of in 8 pages, and the next ten years in 95 pages, of which 43 pages are taken up with three tracts attributed to him. There is practically no information given as to what should be the most important years of his life. The two first volumes carry the narrative to the end of Elizabeth’s reign, when Bacon had passed his fortieth year. There is in them a considerable contribution to the history of the times, but a critical perusal will establish the fact that they add very little to our knowledge of the man, and they fail to give any adequate idea of how he was occupied during those years. In the seven volumes 513 letters of Bacon’s are printed, and of these no less than 238 are addressed to James I. and the Duke of Buckingham, and were written during the last years of his life. The biographies by Montagu and Hepworth Dixon are less pretentious, but contain little more information.

The first published Life of Bacon appears to have been unknown to all these writers. In 1631 was published in Paris a translation of the “Sylva Sylvarum,” as the “Histoire Naturelle de Mre. Francois Bacon.” Prefixed to it is a chapter entitled “Discours sur la vie de Mre. Francois Bacon, Chancelier D’Angleterre.” Reference will be made to this important discourse hereafter. It is sufficient for the present to say that it definitely states that during his youth Bacon travelled in Italy and Spain, which fact is to-day unrecognised by those who are accepted as authorities on his life. In 1647 there was published at Leyden a Dutch translation of forty-six of Bacon’s Essays — the “Wisdom of the Ancients” and the “Religious Meditations.” The translation is by Peter Boener, an apothecary of Nymegen, Holland, who was in Bacon’s service for some years as domestic apothecary, and occasional amanuensis, and quitted his employment in 1623. Boener added a Life of Bacon which is a mere fragment, but contains testimony by a personal attendant which is of value. In 1657 William Rawley issued a

volume of unpublished manuscripts under the title of "Resuscitatio," and to these he added a Life of the great Philosopher. Rawley is only once mentioned by Bacon. His will contains the sentence: "I give to my chaplain, Dr. Rawleigh, one hundred pounds." Rawley was born in 1590. When he became associated with his master is not known, but it could only have been towards the close of his life. Bacon appears to have reposed great confidence in him. In 1627,[2] the year following Bacon's death, he published the "Sylva Sylvarum." This must have been in the press before Bacon's death. Rawley subsequently published other works, and was associated with Isaac Gruter during the seventeenth century in producing on the continent various editions of Bacon's works.

Rawley's account of Bacon's life is meagre, and, having regard to the wealth of information which must have been at his disposal, it is a very disappointing production. Still, it contains information which is not to be found elsewhere. How incomplete it is may be gathered from the fact that there is no reference in it to Bacon's fall.

In 1665 was published a volume, "The Statesmen and Favourites of England since the Reformation." It was compiled by David Lloyd. The biographies of the Elizabethan statesmen were written by someone who was closely associated with them, and who appears to have had exceptional opportunities of obtaining information as to their opinions and characters.[3] As to how these lives came into Lloyd's possession nothing is known. Prefixed to the biographies are two pages containing "The Lord Bacon's judgment in a work of this nature." The chapter on Bacon is a most important contribution to the subject, but it also appears to have escaped the notice of Spedding, Hepworth Dixon, and Montagu. In 1658 Francis Osborn, in Letters to his son, gives a graphic description of the Lord Chancellor. Perhaps one can better picture Bacon as he was in the strength of his manhood from Osborne's account of him than from any other source. Thomas Bushell, another of Bacon's household dependents, published in 1628 "The First Part of Youth's Errors." In a letter therein addressed to Mr. John Eliot, he has left contributions to our stock of knowledge. There are also some miscellaneous

tracts written by him, and published about the year 1660, which contain references to Bacon.

Fuller's Worthies (1660) gives a short account of his life and character, eulogistic but sparse. In 1679 was published "Baconiana," or Certain Genuine Remains of Sir Francis Bacon, &c., by Bishop Tennison, but it contains no better account of his life. Winstanley's Worthies (1684) relies entirely on Rawley's Life, which is reproduced in it. Aubrey's brief Lives were written about 1680. There are references to Bacon in Arthur Wilson's "History of the Reign of James I."; in "The Court of James I.," by Sir W. A.; in "Simeon D'Ewes' Diary"; and, lastly, in his "Discoveries," Ben Jonson contributes a high eulogy on Bacon's character and attainments.

In 1702 Robert Stephens, the Court historiographer, published a volume of Bacon's letters, with an introduction giving some account of his life; and there was a second edition in 1736. In 1740 David Mallet published an edition of Bacon's works, and wrote a Life to accompany it. This was subsequently printed as a separate volume. As a biography it is without interest, as it contains no new facts as to his life.

In 1754 memoirs of the reign of Queen Elizabeth from the year 1581 to her death appeared, edited by Dr. Thomas Birch. These memoirs are founded upon the letters of the various members of the Bacon family. In 1763 a volume of letters of Francis Bacon was issued under the same editor.

Such are the sources of information which have come down to us in biographical notices.

In the British Museum, the Record Office, and elsewhere are the originals of the letters and the manuscripts of some of the tracts which Spedding has printed.

The British Museum also possesses two books of Memoranda used by Bacon. The Transportat is entirely, and the Promus is partly, in his handwriting. Beyond his published works, that is all that so far has been available.

Spedding remarks[4]: "What became of his books which were left to Sir John Constable and must have contained traces of his reading, we do not know, but very few appear to have survived."

Happily, Spedding was wrong. During the past ten years nearly 2,000 books which have passed through Bacon's hands have been gathered together. These are copiously annotated by him, and from these annotations the wide range and the methodical character of his reading may be gathered. Manuscripts which were in his library, and at least four common-place books in his handwriting, have also been recovered. Particulars of these have not yet been made public, but the advantage of access to them has been available in the preparation this volume.

Chapter II. THE STOCK FROM WHICH BACON CAME.

“A prodigy of parts he must be who was begot by wise Sir Nicholas Bacon, born of the accomplished Mrs. Ann Cooke,” says an early biographer.

Nicholas Bacon is said to have been born at Chislehurst, in Kent, in 1509. He was the second son of Robert Bacon, of Drinkstone, in Suffolk, Esquire and Sheep-reeve to the Abbey of Bury St. Edmunds. It is believed that he was educated at the abbey school. He speaks of his intimacy with Edmund Rougham, a monk of that house, who was noted for his wonderful proficiency in memory. He was admitted to the College of Corpus Christi, Cambridge, and took the degree of B.A. in 1526-7. He went to Paris soon afterwards, and on his return studied law at Gray’s Inn, being called to the Bar in 1533, and admitted ancient in 1536. He was appointed, in 1537, Clerk to the Court of Augmentations. In 1546 he was made Attorney of the Court of Wards and Liveries, and continued as such under Edward VI. Upon the accession of Mary he conformed to the change of religion and retained his office during her reign. Nicholas Bacon and William Cecil, each being a widower, had married sisters. When Elizabeth came to the throne Cecil became her adviser. He was well acquainted with Nicholas Bacon’s sterling worth and great capacity for business, and availed himself of his advice and assistance. The Queen delivered to Bacon the great seal, with the title of Lord Keeper, on the 22nd December, 1558, and he was sworn of the Privy Council and knighted. By letters patent, dated 14th April, 1559, the full powers of a Chancellor were conferred upon him. In 1563 he narrowly escaped the loss of his office for alleged complicity in the issue of a pamphlet espousing the cause of the House of Suffolk to the succession. He was restored to favour, and continued as Lord Keeper until his death in 1579. The Queen visited him at Gorhambury on several occasions. Sir Nicholas Bacon, in addition to performing the important duties of his high office in the Court of Chancery and in the Star Chamber, took an important part in all public affairs, both domestic and foreign,

from the accession of Elizabeth until his death. He first married Jane, daughter of William Fernley, of West Creting, Suffolk, by whom he had three sons and three daughters. For his second wife he married Anne, daughter of Sir Anthony Cooke, by whom he had two sons, Anthony and Francis. It is of more importance for the present purpose to know what type of man was the father of Francis Bacon. The author of the "Arte of English Poesie" (1589) relates that he came upon Sir Nicholas sitting in his gallery with the works of Quintillian before him, and adds: "In deede he was a most eloquent man and of rare learning and wisdome as ever I knew England to breed, and one that joyed as much in learned men and good witts." This author, speaking of Sir Nicholas and Burleigh, remarks, "From whose lippes I have seen to proceede more grave and naturall eloquence then from all the oratours of Oxford and Cambridge."

In his "Fragmenta Regalia" Sir Robert Naunton describes him as "an archpeece of wit and wisdom," stating that "he was abundantly facetious which took much with the Queen when it was suited with the season as he was well able to judge of his times." Fuller describes him as "a man of rare wit and deep experience," and, again, as "a good man, a grave statesman, and a father to his country." Bishop Burnet speaks of him as "not only one of the most learned and pious men, but one of the wisest ministers this nation ever bred." The observations of the author of "The Statesmen and Favourites of England in the Reign of Queen Elizabeth" are very illuminating. "Sir Nicholas Bacon," he says, "was a man full of wit and wisdome, a gentleman and a man of Law with great knowledge therein." He proceeds: "This gentleman understood his Mistress well and the times better: He could raise factions to serve the one and allay them to suit the others. He had the deepest reach into affairs of any man that was at the Council table: the knottiest Head to pierce into difficulties: the most comprehensive Judgement to surround the merit of a cause: the strongest memory to recollect all circumstances of a Business to one View: the greatest patience to debate and consider; (for it was he that first said, let us stay a little and we will have done the sooner:) and the clearest reason to urge anything that came in his way in the Court of Chancery.... Leicester seemed wiser than he was,

Bacon was wiser than he seemed to be; Hunsden neither was nor seemed wise.... Great was this Stateman's Wit, greater the Fame of it; which as he would say, *being nothing, made all things*. For Report, though but Fancy, begets Opinion; and Opinion begets substance.... He neither affected nor attained to greatness: *Mediocria firma*, was his principle and his practice. When Queen Elizabeth asked him, *Why his house was so little?* he answered, *Madam, my house is not too little for me, but you have made me too big for my House. Give me*, said he, *a good Estate rather than a great one. He had a very Quaint saying and he used it often to good purpose*, That he loved the Jest well but not the loss of his Friend.... He was in a word, a Father of his country and of *Sir Francis Bacon*."

Before speaking of Lady Ann Bacon, it is necessary to give some account of her father, Sir Anthony Cooke. He was a great-grandson of Sir Thomas Cooke, Lord Mayor of London, and was born at Giddy Hall, in Essex. Again the most valuable observations on his character are to be found in "The Lives of Statesmen and Favourites" before referred to. The author states that Sir Anthony "was one of the Governors to King Edward the sixth when Prince, and is charactered by Mr. Camden *Vir antiqua serenitate*. He observeth him also to be happy in his Daughters, learned above their Sex in Greek and Latine: namely, Mildred who married William Cecil, Lord Treasurer of England; Anne who married Nichlas Bacon, Lord Chancellor of England; Katherine who married Henry Killigrew; Elizabeth who married Thomas Hobby, and afterwards Lord Russell, and Margaret who married Ralph Rowlet."

"Gravity," says this author, "was the Ballast of Sir Anthony's Soul and General Learning its leading.... Yet he was somebody in every Art, and eminent in all, the whole circle of Arts lodging in his Soul. His Latine, fluent and proper; his Greek, critical and exact; his Philology and Observations upon each of these languages, deep, curious, various and pertinent: His Logic, rational; his History and Experience, general; his Rhetorick and Poetry, copious and genuine; his Mathematiques, practicable and useful. Knowing that souls were equal, and that Women are as capable of Learning as Men, he instilled that to his Daughters at night, which he had taught the Prince in the day, being resolved to have Sons by

education, for fear he should have none by birth; and lest he wanted an Heir of his body, he made five of his minde, for whom he had at once a *Gavel-kind* of affection and of Estate."

"Three things there are before whom (was Sir Anthony's saying) I cannot do amis: 1, My Prince; 2, my conscience; 3, my children. Seneca told his sister, That though he could not leave her a good portion, he would leave her a good pattern. Sir Anthony would write to his Daughter *Mildred, My example is your inheritance and my life is your portion*....

"He said first, and his Grandchilde my Lord Bacon after him, That the Joys of Parents are Secrets, and so are their Griefs and Fears.... Very providently did he secure his eternity, by leaving the image of his nature in his children and of his mind in his Pupil.... The books he advised were not *many* but *choice*: the business he pressed was not reading, but digesting.... Sir John Checke talked merrily, Dr. Coxe solidly and Sir Anthony Cooke weighingly: A faculty that was derived with his blood to his Grandchilde Bacon."

Such then was the father of Lady Anne Bacon. She and her sisters were famous as a family of accomplished classical scholars. She had a thorough knowledge of Greek and Latin. An Apologie ... in defence of the Churche of England by Dr. Jewel, Bishop of Salisbury, was translated by her from the Latin and published in 1564. Sir Anthony had been exiled during Mary's reign, for his adherence to the Protestant faith. His daughter, Anne, inherited, not only his classical accomplishments, but his strong Puritan faith and his hatred of Popery. Francis Bacon describes her as "A Saint of God." There is a portrait of her painted by Nathaniel Bacon, her stepson, in which she appears standing in her pantry habited as a cook. In feature Francis appears to have resembled his mother. He "had the same pouting lip, the same round head, the same straight nose and Hebe chin."

Chapter III. FRANCIS BACON, 1560 TO 1572.

In the registry of St. Martin's will be found this entry: Mr. Franciscus Bacon 1560 Jan 25 (*filius D'm Nicho Bacon Magni Angliæ sigilli custodis*)." Rawley in his "Life of the Honourable Author" says: "Francis Bacon, the glory of his age and nation, was born in York House or York Place, in the Strand, on the two and twentieth day of January in the year of our Lord 1560." He relates that "His first and childish years were not without some mark of eminency; at which time he was endued with that pregnancy and towardness of wit, as they were pressages of that deep and universal apprehension which was manifest in him afterward." "The Queen then delighted much to confer with him, and to prove him with questions unto whom he delivered himself with that gravity and maturity above his years that Her Majesty would often term him '*Her young Lord Keeper*.' Being asked by the Queen how old he was he answered with much discretion, being then but a boy[5] that he was two years younger than Her Majesty's happy reign, with which answer the queen was much taken." In the "Lives of the Statesmen and Favourites of Queen Elizabeth" there is reference to the early development of his mental and intellectual faculties. The author writes:— "He had a large mind from his Father and great abilities from his Mother; His parts improved more than his years, his great fixed and methodical memory, his solide judgement, his quick fancy, his ready expression, gave assurance of that profound and universal comprehension of things which then rendered him the observation of great and wise men; and afterwards the wonder of all." The historian continues:— "He never saw anything that was not noble and becoming," "at twelve his industry was above the capacity and his minde beyond the reache of his contemporaries."

This boy so marvellously endowed was brought up in surroundings which were ideal for his development. His father, a man of erudition, a wit and orator, occupying one of the highest positions in the country, his mother a lady of great classical accomplishments, who had enjoyed the benefits of an education and

training by her father, that eminent scholar, Sir Anthony Cooke, and, lastly, there was this man — his grandfather — living within riding distance from his home. It seems inevitable that the natural powers of young Francis must have excited a keen interest in the old tutor of Edward VI., who had devoted his evenings to imparting to his daughters what he had taught the Prince during the day, so that if he left behind him no heirs of his body, he might leave heirs of his mind. The boy Francis was, indeed, a worthy heir of his mind, and it is impossible to believe otherwise than that Sir Anthony Cooke would throw himself heart and soul into the education of his grandchild, but no statement or tradition has come down to this effect. It may be, however, that a sentence which has already been quoted from "The Lives of Statesmen and Favourites" is intended to imply that Francis was the pupil of Sir Anthony: "He said first and his Grandchilde my Lord Bacon after him, That the Joys of Parents are Secrets, and so their Griefs and Fears.... Very providently did he secure his Eternity, by leaving the image of his nature in his Children and of his mind in his Pupil." The pupil referred to was not Edward VI., for he died twenty-three years before Sir Anthony, and he could not, therefore, have left the image of his mind in the young King. Following directly after the sentence "He said first and his Grandchilde Lord Bacon after him" it is possible that the reference may be to the boy Francis. Certainly Sir Anthony "would secure his eternity" if he left the image of his mind in his "Grandchilde." In any case the prodigious natural powers of the boy were placed in an environment well suited for their full development.

The historian says that "at twelve his industry was above the capacity and his mind beyond the reache of his Contemporaries." Who were the contemporaries alluded to? Those of his own age, or those who were living at the time? A boy of twelve, he excelled others in his great industry and the wide range of his mind. This industry appears to have accompanied him through life, for Rawley states that "he would ever interlace a moderate relaxation of his mind with his studies, as walking or taking the air abroad in his coach or some other befitting recreation; and yet he would lose no time, inasmuch as upon the first and immediate return he would fall to reading again, and so suffer no movement of

time to slip from him without some present improvement." It is a remarkable fact on which too much stress cannot be laid that in the two Lives of Bacon, scanty as they are, by contemporary writers, his exceptional industry is pointed out. There are certainly no visible fruits of this industry.

Although there is no definite information as to what was the state of Francis Bacon's education at twelve, there is testimony as to that of some of his contemporaries. Three instances will suffice.

Philip Melancthon (whose family name was Schwartzerd) was born in 1497. His education was at an early age directed by his maternal grandfather, John Reuter. After a short stay at a public school at Bretten he was removed to the academy at Pforzheim. Here, under the tutorship of John Reuchlin, an elegant scholar and teacher of languages, he acquired the taste for Greek literature in which he subsequently became so distinguished. Here his genius for composition asserted itself. Amongst other poetical essays in which he indulged when eleven years of age, he wrote a humorous piece in the form of a comedy, which he dedicated to his kind friend and instructor, Reuchlin, in whose presence it was performed by the schoolfellows of the youthful author. After a residence of two years at Pforzheim, Philip matriculated at the University of Heidelberg on the 13th October, 1509, being eleven years and nine months old. Young as he was, he appears to have been employed to compose most of the harangues that were delivered in the University, besides writing some pieces for the professors themselves. Here, at this early age, he composed his "Rudiments of the Greek Language," which were afterwards published.

Agrippa d'Aubigné was born in 1550 and died in 1630. At six years of age he read Latin, Greek, and Hebrew. When ten years he translated the Crito. Italian and Spanish were at his command.

Thomas Bodley was born in 1544 and died in 1612. In the short autobiography which he left he makes the following statement as to how far his education had advanced when his father decided to fix his abode in the city of Geneva in 1556: —

"I was at that time of twelve yeares age but through my fathers cost and care sufficiently instructed to become an auditour of *Chevalerius* in Hebrew, of *Berealdus* in Greeke, of *Calvin* and *Beza* in Divinity and of some other Professours in that University, (which was newly there erected) besides my domesticall teachers, in the house of Philibertus Saracenus, a famous Physitian in that City with whom I was boarded; when Robertus Constantinus that made the Greek Lexicon read Homer with me."

Bodley was undoubtedly proficient in French, for Calvin and Beza lectured in French. The "Institution of the Christian Religion," Calvin's greatest work, although published in Latin in 1536, was translated by him into French, and issued in 1540 or 1541. This translation is one of the finest examples of French prose. Bodley's English was probably very poor, and for a very good reason — there was no English language worthy of comparison with the languages of France, Italy, or Spain. It had yet to be created.

It is fair to assume that at twelve years of age Francis Bacon was as proficient in languages as were Philip Melancthon, Agrippa d'Aubigné, or Thomas Bodley at that age. He, therefore, had at least a good knowledge of Latin, Greek, Hebrew, French, and such English as there was.

Another class of evidence is now available. It has already been stated that a large number of Bacon's books have been recovered, copiously annotated by him. Some of these books bear the date when the annotations were made. For the most part the marginal notes appear to be aids to memory, but in many cases they are critical observations of the text. These are, however, dealt with in a subsequent chapter.

Gilbert Wats, in dedicating to Charles I. his interpretation of "The Advancement of Proficiency of Learning" (1640), makes a statement which throws light on the course of Bacon's studies, and this strongly supports the present contention. He says: —

"He (Bacon) after he had survaied all the Records of Antiquity, after the volume of men, betook himselfe to the study of the volume of the world; and

having conquerd whatever books possest, set upon the Kingdome of Nature and carried that victory very farre."

Speaking of him as a boy his biographer[6] describes his memory as "fixed and methodical," and in another place he says "His judgment was solid yet his memory was a wonder."

The extent of his reading at this time had been very wide. He had already taken all knowledge to be his province, and was with that industry which was beyond the capacity of his contemporaries rapidly laying the foundations which subsequently justified this claim.

Chapter IV. AT CAMBRIDGE.

Francis Bacon went to reside at Trinity College, Cambridge, in April, 1573, being 12 years and 3 months of age. While the plague raged he was absent from the end of August, 1574, until the beginning of March following. He finally left the University at Christmas, 1575, about one month before his fifteenth birthday.

Rawley says he was there educated and bred under the tuition of Dr. John Whitgift,[7] then master of the College, afterwards the renowned Archbishop of Canterbury, a prelate of the first magnitude for sanctity, learning, patience, and humility; under whom he was observed to have been more than an ordinary proficient in the several arts and sciences.

Amboise, in the "Discours sur la vie de M. Bacon," prefixed to the "Histoire Naturelle," Paris, 1631, says: "Le jugement et la mémoire ne furent jamais en aucun home au degrè qu'ils estoient en celuy-cy; de sorte qu'en bien peu de temps il se rendit fort habile en toutes les sciences qui s'apprennent au Collège. Et quoi que deslors il fust jugé capable des charges les plas importantes, neanmoins pour ne tomber dedans la mesme faute que sont d'ordinaire les jeunes gens de son estoffe, qui par une ambition trop précipitée portent souvent au maniement des grandes affaires un esprit encore tout rempli des crudités de l'escole, Monsieur Bacon se voulut acquérir cette science, qui rendit autres-fois Ulysse si recommandable et luy fit mériter le nom de sage, par la connoissance des mœurs de tant de nations diverses." That is all that can be said about his career at Cambridge except that Rawley adds:

"Whilst he was commorant in the University, about sixteen years of age (as his lordship hath been pleased to impart unto myself), he first fell into the dislike of the philosophy of Aristotle; not for the worthlessness of the author, to whom he would ever ascribe all high attributes, but for the unfruitfulness of the way; being a philosophy (as his lordship used to say) only strong for disputations and contentions, but barren of the production of works for the benefit of the life of man; in which mind he continued to his dying day."

As Bacon left Cambridge at Christmas, 1575, before he was 15 years of age, Rawley's recollection must have been at fault when he mentions the age of 16 as that when Bacon formed this opinion.

There is another account of this incident in which it is stated that Francis Bacon left Cambridge without taking a degree as a protest against the manner in which philosophy was taught there. In the preface to the "Great Instauration" Bacon repeats his protest: "And for its value and utility, it must be plainly avowed that that wisdom which we have derived principally from the Greeks is but like the boyhood of knowledge and has the characteristic property of boys: it can talk but it cannot generate: for it is fruitful of controversies but barren of works."

This is merely a re-statement of the position he took up when at Cambridge. So this boy set up his opinion against that of the recognised professors of philosophy of his day, against the whole authority of the staff of the University, on a fundamental point on the most important question which could be raised as to the pursuit of knowledge. It is not too much to say that he had at this time covered the whole field of knowledge in a manner more thorough than it had ever been covered before, and with his mind, which was beyond the reach of his contemporaries, he began to lay down those laws which revolutionised all thought and have become the accepted method by which the pursuit of knowledge is followed.

It is necessary again to seek for parallels to justify the position which will be claimed for Francis Bacon at this period.

Philip Melancthon affords one and James Crichton another. At Heidelberg Melancthon remained three years. He left when he was 15, the principal cause of his leaving being disappointment at being refused a higher degree in the University solely, it is alleged, on account of his youth. In September, 1512, he was entered at the University of Tubingen, where, in the following year, before he was 17 years of age, he was created Doctor in Philosophy or Master of Arts. He then commenced a course of public lectures, embracing an extraordinary variety of subjects, including the learned languages, rhetoric, logic, ethics,

mathematics, and theology. Here in 1516 he put forth his revision of the text of Terence. Besides he entered into an undertaking with Thomas Anshelmus to revise all the books printed by him. He bestowed great labour on a large work in folio by Nauclerus, which he appears to have almost entirely re-written.

So much romance has been thrown around James Crichton that it is difficult to obtain the real facts of his life. Sir Thomas Urquhart, in "Discovery of a Most Exquisite Jewel," published in 1652, gives a biography which is, without doubt, mainly apocryphal. Certain facts, however, are well established. He was born in the same year as was Bacon (1560). At 10 years of age he entered St. Andrew's University, and in 1575 (the year Bacon left Cambridge) took his degree, coming out third in the first class. In 1576 he went to France, as did Bacon — to Paris. In the College of Navarre he issued a universal challenge. This he subsequently repeated at Venice with equal success; that is, to all men, upon all things, in any of twelve languages named. The challenge is broad and formal. He pledged himself to review the schoolmen, allowed his opponents the privilege of selecting their topics — mathematics, no less than scholastic lore — either from branches publicly or privately taught, and promised to return answers in logical figure or in numbers estimated according to their occult power, or in any of a hundred sorts of verse. He is said to have justified before many competent witnesses his magnificent pretensions.

What Philip Melancthon was at fifteen, what James Crichton was at sixteen, Francis Bacon may have been. All the testimony which his contemporaries afford, especially having regard to his after life, justify the assertion that in knowledge and acquirements he was at least their equal.

About eighteen months later his portrait was painted by Hilliard, the Court miniature painter, who inscribed around it, as James Spedding says, the significant words — the natural ejaculation, we may presume, of the artist's own emotion— "*Si tabula daretur digna animum mallem.*" If one could only find materials worthy to paint his mind.

Chapter V. EARLY COMPOSITIONS.

It is at this stage that the mystery of Francis Bacon begins to develop. Every channel through which information might be expected appears to be blocked. Besides a few pamphlets, in the production of which little time would be occupied, there came nothing from his pen until 1597 when, at the age of 37, the first edition of the essays was published — only ten short essays containing less than 6,000 words. In 1605, when 45, he addressed to James I. the "Two Books on the Advancement of Learning," containing less than 60,000 words. It would require no effort on Bacon's part to write either of these volumes. He could turn out the "Two Books of the Advancement of Learning" with the same facility that a leader writer of the *Times* would write his daily articles. He was to all intents and purposes unoccupied. Until 1594 he had not held a brief, and he never had any practice at the Bar worth considering. He was a member of Parliament, but the House seldom sat, and never for long periods. Bacon's life is absolutely unaccounted for. It is now proposed, by the aid of the literature of the period from 1576 to 1620, and with the help of information derived from his own handwriting, to trace, step by step, the results of his industry, and to supply the reason for the concealment which he pursued.

There is an entry in the Book of Orders of Gray's Inn under date 21st November, 1577, that Anthony and Francis Bacon (who had been admitted members 27th June, 1576, "*de societate magistrorum*") be admitted to the Grand Company, *i.e.*, to the Degree of Ancients, a privilege to which they were entitled as sons of a judge. From a letter subsequently written by Burghley, it is known that one Barker was appointed as their tutor of Law. Apparently it was intended that they should settle down to a course of legal training, but this plan was abandoned, at any rate, as far as Francis was concerned. Sir Amias Paulet, who was Chancellor of the Garter, a Privy Counsellor, and held in high esteem by the Queen,[8] was about to proceed to Paris to take the place of Dr. Dale as Ambassador at the Court of France. There is a letter written from Calais, dated

25th September, 1576, from Sir Amias to Lord Burghley, in which this paragraph appears: “My ordinary train is no greater than of necessity, being augmented by some young gentlemen, whereof one is Sir Nicholas Throgmorton’s son, who was recommended to me by her Majesty, and, therefore, I could not refuse him. The others are so dear to me and the most part of them of such towardness, as my good hope of their doing well, and thereafter they will be able to serve their Prince and country, persuades me to make so much to excuse my folly as to entreat you to use your favour in my allowance for my transportations, my charges being increased by these extraordinary occasions.”

Francis Bacon was one of this group of young gentlemen. Rawley states that “after he had passed the circle of the liberal arts, his father thought fit to frame and mould him for the arts of state; and for that end sent him over into France with Sir Amyas Paulet then employed Ambassador lieger into France.”

There are grounds for believing that Bacon’s literary activity had commenced before he left England. There is abundant evidence to prove that it was the custom at this period for authors who desired to conceal their authorship to substitute for their own names, initials or the names of others on the title-pages. Two instances will suffice: “The Arte of English Poesie” was published in 1589, but written several years previously. The author says:— “I know very many notable Gentlemen in the Court that have written commendably, and suppressed it agayne, or els suffred it to be publisht without their owne names to it as if it were a discredit for a Gentleman to seeme learned, and to shew himself amorous of any learned Art.” There is a bare-faced avowal of how names were placed on title-pages in a letter which exists from Henry Cuffe to Mr. Reynolds. Cuffe, an Oxford scholar of distinction, was a close companion and confidant of Essex. After the capture and sacking of Cadiz by Essex and Howard, the former deemed it important that his version of the affair should be the first to be published in England. Cuffe, therefore, started off post haste with the manuscript, but was taken ill on his arrival at Portsmouth, and could not proceed. He despatched the manuscript by a messenger with a letter to “Good Mr. Reynoldes,” who was a

private Secretary of Essex. He was to cause a transcript to be made and have it delivered to some good printer, in good characters and with diligence to publish it. Reynoldes was to confer with Mr. Greville (Fulke Greville, afterwards Lord Brooke) "whether he can be contented to suffer the two first letters of his name to be used in the inscription." "If he be unwilling," adds Cuffe, "you may put R.B. which some no doubt will interprete to be Beale, but it skills not." That this was a common practice is admitted by those acquainted with Elizabethan literature. If any of Bacon's writings were published prior to the trifle which appeared in 1597 as Essaies, his name was suppressed, and it would be probable some other name would appear on the title-page. There is a translation of a classical author, bearing date 1572, which is in the Baconian style, but which need not be claimed for him without further investigation.

The following suggestion is put forward with all diffidence, but after long and careful investigation. Francis Bacon was the author of two books which were published, one before he left England, and the other shortly after. The first is a philosophical discourse entitled "The Anatomie of the Minde." Newlie made and set forth by T.R. Imprinted at London by I.C. for Andrew Maunsell, 1576, 12mo. The dedication is addressed to Master Christopher Hatton, and the name of Tho. Rogers is attached to it. There was a Thomas Rogers who was Chaplain to Archbishop Bancroft, and the book has been attributed to him, apparently only because no other of the same name was known. There was published in 1577 a translation by Rogers of a Latin book "Of the Ende of the World, etc." and there are other translations by him published between then and 1628. There are several sermons, also, but the style of these, the matter, and the manner of treatment are quite distinct from those of the book under consideration. There is nothing of his which would support the assignment to him of "The Anatomie of the Mind." It is foreign to his style.

Having regard to the acknowledged custom of the times of putting names other than the author's on title-pages, there is no need for any apology for expressing doubt as to whether the book has been correctly placed to the credit of the Bishop Bancroft's chaplain. In the address To the Reader the author says:

"I dyd once for my profite in the Universitie, draw into Latin tables, which since for thy profite (Christian Reader) at the request of a gentleman of good credite and worship, I have Englished and published in these two books." There is in existence a copy of the book with the printer's and other errors corrected in Bacon's own handwriting.

Bearing date 1577, imprinted at London for Henri Cockyn, is an octavo book styled, *"Beautiful Blossoms" gathered by John Byshop from the best trees of all kyndes, Divine, Philosophicall, Astronomicall, Cosmographical, Historical and Humane that are growing in Greece, Latium, and Arabia, and some also in vulgar orchards as wel fro these that in auncient time were grafted, as also from them which with skilful head and hand beene of late yeare's, yea, and in our dayes planted: to the unspeakable, both pleasure and profite of all such as wil vouchsafe to use them.* On the title-page are the words, "The First Tome," but no further volume was published. As to who or what John Byshop was there is no information available. His name appears on no other book. The preface is a gem of musical sounding words. It contains the sentence, "let them pass it over and read the rest which are all as plaine as Dunstable Way." Bacon's home was within a few miles of Dunstable Way, which was the local term for the main road.

It is impracticable here to give at length the grounds upon which it is believed that Francis Bacon was the author of these two books. Each of them is an outpouring of classical lore, and is evidently written by some young man who had recently assimilated the writings of nearly every classical author. In this respect both correspond with the manner of "The French Academie," to which the attention of the reader will shortly be directed, whilst in "The Anatomie of the Minde" the treatment of the subject is identical with that in the latter. Failing actual proof, the circumstantial evidence that the two books are from the same pen is almost as strong as need be.

Some time in October, 1576, Sir Amyas Paulet would reach Paris, accompanied by Bacon. The only fragment of information which is given by his biographers of any occurrence during his stay there is obtained from Rawley. He

states that “Sir Amias Paulet after a while held him fit to be entrusted with some message, or advertisement to the Queen, which having performed with great approbation, he returned back into France again with intention to continue for some years there.” In his absence in France, his father, the Lord Keeper, died. This was in February, 1578-9. If he returned shortly after news of his father’s death reached him, his stay on the Continent would cover about two and a-half years. As to what he was doing nothing is known, but Pierre Amboise states that “France, Italy, and Spain as the most civilised nations of the whole world were those whither his desire for Knowledge carried him.”

Chapter VI. BACON'S "TEMPORIS PARTUS MAXIMUS."

Francis Bacon was at Blois with Sir Amias Paulet in 1577. In the same year was published the first edition of the first part of "Académie Francoise par Pierre de la Primaudaye Esceuyer, Seignor dudict lieu et de la Barrée, Gentilhomme ordinaire de la chambre du Roy." The dedication, dated February, 1577 (*i.e.*, 1578) is addressed, "Au Tres-chrestien Roy de France et de Polongne Henry III. de ce nom." The first English translation, by T. B., was "published in 1586[9], imprinted at London by Edmund Bollifant for G. Bishop and Ralph Newbery." Other parts of "The Academy" followed at intervals of years, but the first and only complete edition in English bears date 1618, and was printed for Thomas Adams. Over the dedication is the well-known archer emblem. It is a thick folio volume, with 1,038 pages double columns. It may be termed the first Encyclopædia which appeared in any language, and is, perhaps, one of the most remarkable productions of the Elizabethan era. Little is known of Pierre de la Primaudaye. The particulars for his biography in the "Biographie Nationale" seem to have been taken from references made to the author in the "French Académie" itself. In the French Edition, 1580, there is a portrait of a man, and under it the words "Anag. de L'auth. Par la prierè Dieu m'ayde." The following is an extract from the dedication: —

"The dinner of that prince of famous memorie, was a second table of Salomon, vnto which resorted from euerie nation such as were best learned, that they might reape profit and instruction. Yours, Sir, being compassed about with those, who in your presence daily discourse of, and heare discoursed many graue and goodly matters, seemeth to be a schoole erected to teach men that are borne to vertue. And for myselfe, hauing so good hap during the assemblie of your Estates at Blois, as to be made partaker of the fruit gathered thereof, it came in my mind to offer vnto your Maiestie a dish of diuers fruits, which I gathered in a Platonicall garden or orchard, otherwise called an Academie, where I was not

long since with certaine yoong Gentlemen of Aniou my companions, discoursing togither of the institution in good maners, and of the means how all estates and conditions may liue well and happily. And although a thousand thoughts came then into my mind to hinder my purpose, as the small authoritie, which youth may or ought to haue in counsell amongst ancient men: the greatnes of the matter subject, propounded to be handled by yeeres of so small experience; the forgetfulness of the best foundations of their discourses, which for want of a rich and happie memorie might be in me: my iudgement not sound ynough, and my profession vnfit to set them downe in good order: briefly, the consideration of your naturall disposition and rare vertue, and of the learning which you receiuve both by reading good authors, and by your familiar communication with learned and great personages that are neere about your Maiestie (whereby I seemed to oppose the light of an obscure day, full of clouds and darkness, to the bright beames of a very cleere shining sonne, and to take in hand, as we say, to teach Minerua). I say all these reasons being but of too great weight to make me change my opinion, yet calling to mind manie goodlie and graue sentences taken out of sundry Greeke and Latine Philosophers, as also the woorthie examples of the liues of ancient Sages and famous men, wherewith these discourses were inriched, which might in delighting your noble mind renew your memorie with those notable sayings in the praise of vertue and dispraise of vice, which you alwaies loued to heare: and considering also that the bounty of Artaxerxes that great Monarke of the Persians was reuiued in you, who receiued with a cheerfull countenance a present of water of a poore laborer, when he had no need of it, thinking to be as great an act of magnanimitie to take in good part, and to receiue cheerfully small presents offered with a hartie and good affection, as to giue great things liberally, I ouercame whatsoeuer would haue staied me in mine enterprise."

It appears, therefore, that the author by good hap was a visitor at the Court of Henry III. when at Blois; that he was there studying with certain young gentlemen of Anjou, his companions; that he was a youth, and of years of small experience; that his memory might not be sufficiently rich and happy, his

judgment not enough, and his profession unfit in recording the discourses of himself and his companions.

"The Author to the Reader" is an essay on Philosophy, every sentence in which seems to have the same familiar sound as essays which subsequently appeared under another name. The contents of the several chapters are enumerated thus: "Of Man," "Of the Body and Soule," *etc.*

The first chapter contains a description of how the "Academie" came about. An ancient wise gentleman of great calling having spent the greater part of his years in the service of two kings, and of his country, France, for many and good causes had withdrawn himself to his house. He thought that to content his mind, which always delighted in honest and vertuous things, he could not bring greater profit to the Monarchie of France, than to lay open and preserve and keep youth from the corruption which resulted from the over great license and excessive liberty granted to them in the Universities. He took unto his house four young gentlemen, with the consent of their parents who were distinguished noblemen. After he had shown these young men the first grounds of true wisdom, and of all necessary things for their salvation, he brought into his house a tutor of great learning and well reported of his good life and conversation, to whom he committed their instruction. After teaching them the Latin tongue and some smattering of Greek he propounded for their chief studies the moral philosophy of ancient sages and wise men, together with the understanding and searching out of histories which are the light of life. The four fathers, desiring to see what progress their sons had made, decided to visit them. And because they had small skill in the Latin tongue, they determined to have their children discourse in their own natural tongue of all matters that might serve for the instruction and reformation of every estate and calling, in such order and method as they and their master might think best. It was arranged that they should meet in a walking place covered over with a goodly green arbour, and daily, except Sundays, for three weeks, devote two hours in the morning and two hours after dinner to these discourses, the fathers being in attendance to listen to their sons. So interesting did these discussions become that the period was often extended to three or four

hours, and the young men were so intent upon preparation for them that they would not only bestow the rest of the days, but oftentimes the whole night, upon the well studying of that which they proposed to handle. The author goes on to say:— "During which time it was my good hap to be one of the companie when they began their discourses, at which I so greatly wondered that I thought them worthy to be published abroad." From this it would appear that the author was a visitor, privileged, with the four fathers and the master, to listen to the discourses of these four young men. But, a little further on the position is changed; one of the four young men is, without any explanation, ignored, and his father disappointed! For the author takes his place, as will be seen from the following extract: —

"And thus all fower of us followed the same order daily until everie one in his course had intreated according to appointment, both by the precepts of doctrine, as also by the examples of the lives of ancient Sages and famous men, of all things necessary for the institution of manners and happie life of all estates and callings in this French Monarchie. But because I knowe not whether, in naming my companions by their proper names, supposing thereby to honour them as indeede they deserve it, I should displease them (which thing I would not so much as thinke) I have determined to do as they that play on a Theater, who under borrowed maskes and disguised apparell, do represent the true personages of those whom they have undertaken to bring on the stage. I will therefore call them by names very agreeable to their skill and nature: the first Aser which signifieth *Felicity*: the second Amana which is as much to say as *Truth*: the third Aram which noteth to us *Highness*; and to agree with them as well in name as in education and behaviour. I will name myself Achitob[10] which is all one with *Brother of goodness*. Further more I will call and honour the proceeding and finishing of our sundry treatises and discourses with this goodlie and excellent title of Academie, which was the ancient and renowned school amongst the Greek Philosophers, who were the first that were esteemed, and that the place where Plato, Xenophon, Poleman, Xenocrates, and many other excellent personages, afterward called Academicks, did propound & discourse of all

things meet for the instruction and teaching of wisdome: wherein we purposed to followe them to our power, as the sequele of our discourses shall make good proofe."

And then the discourses commence.

"Love's Labour's Lost" was published in 1598, and was the first quarto upon which the name of Shakespeare was printed. The title-page states that it is "newly corrected and augmented," from which it may be inferred that there was a previous edition, but no copy of such is known. The commentators are in practical agreement that it was probably the first play written by the dramatist.

There are differences of opinion as to the probable date when it was written. Richard Grant White believes this to be not later than 1588, Knight gives 1589, but all this is conjecture.

The play opens with a speech by Ferdinand: —

"Let Fame that all hunt after in their lives,
Live registred upon our brazen Tombes,
And then grace us, in the disgrace of death:
When spight of cormorant devouring time,
Th' endevour of this present breath may buy:
That honour which shall bate his sythes keene edge,
And make us heyres of all eternitie.
Therefore brave Conquerours, for so you are,
That warre against your own affections,
And the huge Armie of the worlds desires.
Our late Edict shall strongly stand in force,
Navar shall be the wonder of the world.
Our Court shall be a little Achademe,
Still and contemplative in living Art.
You three, Berowne, Doumaine, and Longavill,
Have sworne for three yeeres terme, to live with me,
My fellow Schollers, and to keepe those statutes
That are recorded in this schedule heere.

Your oathes are past, and now subscribe your names;
That his owne hand may strike his honour downe,
That violates the smallest branch heerein:
If you are arm'd to doe, as sworne to do,
Subscribe to your deepe oathes, and keepe it to."

Four young men in the French "Academie" associated together, as in "Love's Labour Lost," to war against their own affections and the whole army of the world's desires. Dumaine, in giving his acquiescence to Ferdinand, ends: —

"To love, to wealth, to pompe, I pine and die
With all these living in Philosophie."

Philosophie was the subject of study of the four young men to the "Academie."

Berowne was a visitor, for he says: —
"I only swore to study with your grace
And stay heere in your Court for three yeeres' space."

Upon his demurring to subscribe to the oath as drawn, Ferdinand retorts: —

Well, sit you out: go home, Berowne: adue."

To which Berowne replies: —

No, my good lord; I have sworn to stay with you."

Achitob was a visitor at the Academie in France. There are other points of resemblance, but sufficient has been said to warrant consideration of the suggestion that the French "Academie" contains the serious studies of the four young men whose experiences form the subject of the play.

The parallels between passages in the Shakespeare plays and the French "Academie" are numerous, but they form no part of the present contention.

One of these may, however, be mentioned. In the third Tome the following passage occurs[11]: —

Psal. xix.: “It is not without cause that the Prophet said (The heavens declare the glory of God, and the earth sheweth the workes of his handes) For thereby he evidently teacheth, as with the finger even to our eies, the great and admirable providence of God their Creator; even as if the heavens should speake to anyone. In another place it is written (Eccles. xliii.): (This high ornament, this cleere firmament, the beauty of the heaven so glorious to behold, tis a thing full of Majesty).”

On turning to the revised version of the Bible it will be found that the first verse is thus translated: “The pride of the height, the cleare firmament the beauty of heaven with his glorious shew.” The rendering of the text in “The French Academy” is strongly suggestive of Hamlet’s famous soliloquy. “This most excellent canopy, this brave o’erhanging firmament, this majestical roof fritted with golden fire, why it appears to me no other than a foul and pestilent congregation of vapours.” The author has forsaken the common-place rendering of the Apocrypha, and has adopted the same declamatory style which Shakespeare uses. It is strongly reminiscent of Hamlet’s famous speech, Act II., scene ii.

Only one of the Shakespeare commentators makes any reference to the work. The Rev. Joseph Hunter, writing in 1844, points out that the dramatist in “As You Like It,” describing the seven ages of man, follows the division made in the chapter on “The Ages of Man” in the “Academie.”[12]

The suggestion now made is that the French “Academie” was written by Bacon, who is represented in the dialogues as Achitob — the first part when he was about 18 years of age, that he continued it until, in 1618, the complete work was published. In the dedication the author describes himself as a youth of immature experience, but the contents bear evidence of a wide knowledge of classical authors and their works, a close acquaintance with the ancient philosophies, and a store of general information which it would be impossible for any ordinary youth of such an age to possess. But was not the boy who at 15 years of age left Cambridge disagreeing with the teaching there of Aristotle’s philosophy, and whose mental qualities and acquirements provoked as “the

natural ejaculation of the artist's emotion" the significant words, "*Si tabula daretur digna animum mallem*," altogether abnormal?

Was the "French Academie" Bacon's *temporis partus maximus*? It is only in a letter written to Father Fulgentio about 1625 that this work is heard of. Bacon writes: "Equidem memini me, quadraginta abhinc annis, juvenile opusculum circa has res confecisse, quod magna prorsus fiducia et magnifico titulo 'Temporis Partum Maximum' inscripsi."[13]

Spedding says: "This was probably the work of which Henry Cuffe (the great Oxford scholar who was executed in 1601 as one of the chief accomplices in the Earl of Essex's treason) was speaking when he said that 'a fool could not have written it and a wise man would not.' Bacon's intimacy with Essex had begun about thirty-five years before this letter was written."

Forty years from 1625 would carry back to 1585, the year preceding the date of publication of the first edition in English. If Cuffe's remark was intended to apply to the "French Academy," it is just such a criticism as the book might be expected to provoke.

The first edition of "The French Academie" in English appeared in 1586, the second in 1589, the third (two parts) in 1594, the fourth (three parts) in 1602, the fifth in 1614 (all quartos), then, in 1618, the large folio edition containing the fourth part "never before published in English." It appears to have been more popular in England than it was in France. Brunet in his 1838 edition mentions neither the book nor the author, Primaudaye. The question as to whether there was at this time a reading public in England sufficiently wide to absorb an edition in numbers large enough to make the publication of this and similar works possible at a profit will be dealt with hereafter. In anticipation it may be said that the balance of probabilities justifies the conjecture that the issue of each of these editions involved someone in loss, and the folio edition involved considerable loss.

A comparison between the French and English publications points to both having been written by an author who was a master of each language rather than that the latter was a mere translation of the former. The version is so natural in

idiom and style that it appears to be an original rather than a translation. In 1586 how many men were there who could write such English? The marginal notes are in the exact style of Bacon. “A similitude”— “A notable comparison” — occur frequently just as the writer finds them again and again in Bacon’s handwriting in volumes which he possesses. The book abounds in statements, phrases, and quotations which are to be found in Bacon’s letters and works.

One significant fact must be mentioned. The first letter of the text in the dedication in the first English translation is the letter S. It is printed from a wood block (Fig. I.). Thirty-nine years after (in 1625) when the last edition of Bacon’s Essays — and, with the exception of the small pamphlet containing his versification of certain Psalms, the last publication during his life — was printed, that identical wood block (Fig. II.) was again used to print the first letter in the dedication of that book. Every defect and peculiarity in the one will be found in the other. A search through many hundreds of books printed during these thirty-nine years — 1586 to 1625 — has failed to find it used elsewhere, except on one occasion, either then, before, or since.

Fig. I.

The first letter in the text of the dedication of the 1st edition of the English translation of the "French Academie," **1586**. Printed at London by G. Bollifant. The block is also used in a similar manner in the 2nd edition, **1589**. Londini Impensis, John Bishop.

Fig. II.

The first letter in the text of the dedication of the **1625** edition of Bacon's Essays, printed in London, by John Haviland.

Both letters were printed from the same block.

Did Bacon mark his first work on philosophy and his last book by printing the first letter in each from the same block?[14]

Chapter VII. BACON'S FIRST ALLEGORICAL ROMANCE.

There is another work which it is impossible not to associate with this period, and that is John Barclay's "Argenis." It is little better known than is "The French Academy," and yet Cowper pronounced it the most amusing romance ever written. Cardinal Richelieu is said to have been extremely fond of reading it, and to have derived thence many of his political maxims. It is an allegorical novel. It is proposed now only to mention some evidence connected with the "Argenis" which supports the contention that the 1625 English edition contains the original composition, and that its author was young Francis Bacon.

The first edition of the "Argenis" in Latin was published in 1621. The authority to the publisher, Nicholas Buon, to print and sell the "Argenis" is dated the 21st July, 1621, and was signed by Barclay at Rome. The Royal authority is dated on the 31st August following.

Barclay's death took place between these dates, on the 12th of August, at Rome. It is reported that the cause of death was stone, but in an appreciation of him, published by his friend, Ralph Thorie, his death is attributed to poison.

The work is an example of the highest type of Latinity. So impressed was Cowper with its style that he stated that it would not have dishonoured Tacitus himself. A translation in Spanish was published in 1624, and in Italian in 1629. The Latin version was frequently reprinted during the seventeenth and eighteenth centuries — perhaps more frequently than any other book.

In a letter dated 11th May, 1622, Chamberlain, writing to Carleton, says: "The King has ordered Ben Jonson to translate the 'Argenis,' but he will not be able to equal the original." On the 2nd October, 1623, Ben Jonson entered a translation in Stationers' Hall, but it was never published. About that time there was a fire in Jonson's house, in which it is said some manuscripts were destroyed; but it is a pure assumption that the "Argenis" was one of these.

In 1629 an English translation appeared by Sir Robert Le Grys, Knight, and the verses by Thomas May, Esquire. The title-page bears the statement: “The prose upon his Majesty’s command.” There is a Clavis appended, also stated to be “published at his Majesties command.” It was printed by Felix Kyngston for Richard Mughten and Henry Seile. In the address to “The understanding Reader” Le Grys says, “What then should I say? Except it were to entreate thee, that where my English phrase doth not please thee, thou wilt compare it with the originall Latin and mend it. Which I doe not speak as thinking it impossible, but as willing to have it done, for the saving me a labour, who, if his Majesty had not so much hastened the publishing it, would have reformed some things in it, that did not give myselfe very full satisfaction.”

In 1622 King James ordered a translation of the “Argenis.” In 1629[15] Charles I. was so impatient to have a translation that he hastened the publication, thus preventing the translator from revising his work. Three years previously, however, in 1625 — if the date may be relied on — there was published as printed by G. P. for Henry Seile a translation by Kingesmill Long. James died on the 25th March, 1625. The “Argenis” may not have been published in his lifetime; but if the date be correct, three or four years before Charles hastened the publication of Le Grys’s translation, this far superior one with Kingesmill Long’s name attached to it could have been obtained from H. Seile. Surely the publisher would have satisfied the King’s impatience by supplying him with a copy of the 1625 edition had it been on sale. The publication of a translation of the “Argenis” must have attracted attention. Is it possible that it could have been in existence and not brought to the notice of the King? There is something here that requires explanation. The Epistle Dedicatorie of the 1625 edition is written in the familiar style of another pen, although it bears the name of Kingesmill Long. The title-page states that it is “faithfully translated out of Latine into English,” but it is not directly in the Epistle Dedicatorie spoken of as a translation. The following extract implies that the work had been lying for years waiting publication: —

"This rude piece, such as it is, hath long lyen by me, since it was finished; I not thinking it worthy to see the light. I had always a desire and hope to have it undertaken by a more able workman, that our Nation might not be deprived of the use of so excellent a Story: But finding none in so long time to have done it; and knowing that it spake not *English*, though it were a rich jewell to the learned Linguist, yet it was close lockt from all those, to whom education had not given more languages, than Nature Tongues: I have adventured to become the key to this piece of hidden Treasure, and have suffered myselfe to be overruled by some of my worthy friends, whose judgements I have alwayes esteemed, sending it abroad (though coursely done) for the delight and use of others."

Not a word about the author! The translations, said to be by Thomas May, of the Latin verses in the 1629 are identical with those in the 1625 edition, although Kingesmill Long, on the title-page, appears as the translator. Nothing can be learnt as to who or what Long was.

Over lines "Authori," signed Ovv: Fell:[16] in the 1625 edition is one of the well-known light and dark A devices. This work is written in flowing and majestic English; the 1629 edition in the cramped style of translation.

The copy bearing date 1628, to which reference has been made, belonged to John Henry Shorthouse. He has made this note on the front page: "Jno. Barclay's description of himself under the person of Nicopompus Argenis, p. 60." This is the description to which he alludes: —

"Him thus boldly talking, Nicopompus could no longer endure: he was a man who from his infancy loved Learning; but who disdaining to be nothing but a booke-man had left the schooles very young, that in the courts of Kings and Princes, he might serve his apprenticeship in publicke affairs; so he grew there with an equall abilitie, both in learning and imployment, his descent and disposition fitting him for that kind of life: wel esteemed of many Princes, and especially of Meleander, whose cause together with the rest of the Princes, he had taken upon him to defend."

This description is inaccurate as applied to John Barclay, but in every detail it describes Francis Bacon.

A comparison has been made between the editions of 1625 and 1629 with the 1621 Latin edition. It leaves little room for doubting that the 1625 is the original work. Throughout the Latin appears to follow it rather than to be the leader; whilst the 1629 edition follows the Latin closely. In some cases the word used in the 1625 edition has been incorrectly translated into the 1621 edition, and the Latin word re-translated literally and incorrectly in view of the sense in the 1629 edition. But space forbids this comparison being further followed; suffice it to say that everything points to the 1625 edition being the original work.

As to the date of composition much may be said; but the present contention is that “The French Academie,” “The Argenis,” and “Love’s Labour’s Lost” are productions from the same pen, and that they all represent the work of Francis Bacon probably between the years 1577 and 1580. At any rate, the first-named was written whilst he was in France, and the others were founded on the incidents and experience obtained during his sojourn there.

Chapter VIII. BACON IN FRANCE, 1576-1579.

This brilliant young scholar landed with Sir Amias Paulet at Calais on the 25th of September, 1576, and with him went straight to the Court of Henry III. of France. It is remarkable that neither Montagu, Spedding, Hepworth Dixon, nor any other biographer seems to have thought it worth while to consider under what influences he was brought when he arrived there at the most impressionable period of his life. Hepworth Dixon, without stating his authority, says that he "quits the galleries of the Louvre and St. Cloud with his morals pure," but nothing more. And yet Francis Bacon arrived in France at the most momentous epoch in the history of French literature. This boy, with his marvellous intellect — the same intellect which nearly half a century later produced the "Novum Organum" — with a memory saturated with the records of antiquity and with the writings of the classical authors, with an industry beyond the capacity and a mind beyond the reach of his contemporaries, skilled in the teachings of the philosophers, with independence of thought and a courage which enabled him to condemn the methods of study followed at the University where he had spent three years; this boy who had a "beam of knowledge derived from God" upon him, who "had not his knowledge from books, but from some grounds and notions from himself," and above and beyond all who was conscious of his powers and had unbounded confidence in his capacity for using them; this boy walked beside the English Ambassador elect into the highest circles of French Society at the time when the most important factors of influence were Ronsard and his confrères of the Pléiade. He had left behind him in his native country a language crude and almost barbaric, incapable of giving expression to the knowledge which he possessed and the thoughts which resulted therefrom.

At this time there were few books written in the English tongue which could make any pretence to be considered literature: Sir Thomas Eliot's "The Governor," Robert Ascham's "The Schoolmaster," and Thomas Wright's "Arts

of Rhetoric," almost exhaust the list. Thynne's edition, 1532, and Lidgate's edition, 1561, of Chaucer's works are not intelligible. Only in the 1598 edition can the great poet be read with any understanding. The work of re-casting the poems for this edition was Bacon's, and he is the man referred to in the following lines, which are prefixed to it: — *The Reader to Geffrey Chaucer.*

Rea. — Where hast thou dwelt, good Geffrey al this while,
Unknown to us save only by thy bookes?

Chau. — In haulks, and hernes, God wot, and in exile,
Where none vouchsaft to yeeld me words or lookes:
Till one which saw me there, and knew my friends,
Did bring me forth: such grace sometimes God sends.

Rea. — But who is he that hath thy books repar'd,
And added moe, whereby thou are more graced?

Chau. The selfe same man who hath no labor spar'd,
—
To helpe what time and writers had defaced:
And made old words, which were unknoun of many,
So plaine, that now they may be knoun of any.

Rea. Well fare his heart: I love him for thy sake,
—
Who for thy sake hath taken all this pains.

Chau. Would God I knew some means amends to
— make,
That for his toile he might receive some gains.
But wot ye what? I know his kindnesse such,
That for my good he thinks no pains too much:
And more than that; if he had knoune in time,
He would have left no fault in prose nor rime.

There is a catalogue of the library of Sir Thomas Smith[17] on August 1, 1566, in his gallery at Hillhall. It was said to contain nearly a thousand books. Of these only five were written in the English language. Under Theologici, K. Henry VIII. book; under Juris Civilis, Littleton's Tenures, an old abridgement of Statutes; under Historiographi, Hall's Chronicles, and Fabian's Chronicles and The Decades of P. Martyr; under Mathematica, The Art of Navigation. The remainder are in Greek, Latin, French, and Italian. Burghley's biographer states that Burghley "never read any books or praiers but in Latin, French, or Italian, very seldom in Englishe."

At this time Francis Bacon thought in Latin, for his mother tongue was wholly insufficient. There is abundant proof of this in his own handwriting. Under existing conditions there could be no English literature worthy of the name. If a Gentleman of the Court wrote he either suppressed his writings or suffered them to be published without his name to them, as it was a discredit for a gentleman to seem learned and to show himself amorous of any good art. Here is where Spedding missed his way and never recovered himself. Deep as is the debt of gratitude due to him for his devoted labours in the preparation of "Bacon's Life and Letters" and in the edition of his works, it must be asserted that he accomplished this work without seeing Francis Bacon. There was a vista before young Bacon's eyes from which the practice of the law and civil dignities were absent. He arrived at the French Court at the psychological moment when an object-lesson met his eyes which had a more far-reaching effect on the language and literature of the Anglo-Saxon race than any or all other influences that have conspired to raise them to the proud position which to-day they occupy. It is necessary briefly to explain the position of the French language and literature at this juncture.

The French Renaissance of literature had its beginning in the early years of the sixteenth century. It had been preceded by that of Italy, which opened in the fourteenth century, and reached its limit with Ariosto and Tasso, Macchiavelli and Guicciardini during the sixteenth century. Towards the end of the fifteenth

century modern French poetry may be said to have had its origin in Villon and French prose in Comines. The style of the former was artificial and his poems abounded in recurrent rhymes and refrains. The latter had peculiarities of diction which were only compensated for by weight of thought and simplicity of expression. Clement Marot, who followed, stands out as one of the first landmarks in the French Renaissance. His graceful style, free from stiffness and monotony, earned for him a popularity which even the brilliancy of the Pléiade did not extinguish, for he continued to be read with genuine admiration for nearly two centuries. He was the founder of a school of which Mellia de St. Gelais, the introducer of the sonnet into France, was the most important member. Rabelais and his followers concurrently effected a complete revolution in fiction. Marguerite of Navarre, who is principally known as the author of "The Heptameron," maintained a literary Court in which the most celebrated men of the time held high place. It was not until the middle of the sixteenth century that the great movement took place in French literature which, if that which occurred in the same country three hundred years subsequently be excepted, is without parallel in literary history.

The Pléiade consisted of a group of seven men and boys who, animated by a sincere and intelligent love of their native language, banded themselves together to remodel it and its literary forms on the methods of the two great classical tongues, and to reinforce it with new words from them. They were not actuated by any desire for gain. In 1549 Jean Daurat, then 49 years of age, was professor of Greek at le Collège de Coqueret in Paris. Amongst those who attended his classes were five enthusiastic, ambitious youths whose ages varied from seventeen to twenty-four. They were Pierre de Ronsard, Joachim du Bellay, Remy Belleau, Antoine de Baïf, and Etienne Jodelle. They and their Professor associated themselves together and received as a colleague Pontus de Tyard, who was twenty-eight. They formed a band of seven renovators, to whom their countrymen applied the cognomen of the Pléiade, by which they will ever be known. Realising the defects and possibilities of their language, they recognised that by appropriations from the Greek and Latin languages, and from the

melodious forms of the Italian poetry, they might reform its defects and develop its possibilities so completely that they could place at the service of great writers a vehicle for expression which would be the peer if not the superior of any language, classical or modern. It was a bold project for young men, some of whom were not out of their teens, to venture on. That they met with great success is beyond question; the extent of that success it is not necessary to discuss here. The main point to be emphasised is that it was a deliberate scheme, originated, directed, and matured by a group of little more than boys. The French Renaissance was not the result of a spontaneous bursting out on all sides of genius. It was wrought out with sheer hard work, entailing the mastering of foreign languages, and accompanied by devotion and without hope of pecuniary gain. The manifesto of the young band was written by Joachim de Bellay in 1549, and was entitled, "La Défense et Illustration de la langue Francaise." In the following year appeared Ronsard's Ode — the first example of the new method. Pierre de Ronsard entered Court life when ten years old. In attendance on French Ambassadors he visited Scotland and England, where he remained for some time. A severe illness resulted in permanent deafness and compelled him to abandon his profession, when he turned to literature. Although Du Bellay was the originator of the scheme, Ronsard became the director and the acknowledged leader of the band. His accomplishments place him in the first rank of the poets of the world. Reference would be out of place here to the movement which was after his death directed by Malherbe against Ronsard's reputation and fame as a poet and his eventual restoration by the disciples of Sainte Beuve and the followers of Hugo. It is desirable, however, to allude to other great Frenchmen whose labours contributed in other directions to promote the growth of French literature. Jean Calvin, a native of Noyon, in Picardy, had published in Latin, in 1536, when only twenty-seven years of age, his greatest work, both from a literary and theological point of view, "The Institution of the Christian Religion," which would be accepted as the product of full maturity of intellect rather than the firstfruits of the career of a youth. What the Pléiade had done to create a French language adequate for the highest expression of poetry Calvin

did to enable facility in argument and discussion. A Latin scholar of the highest order, avoiding in his compositions a tendency to declamation, he developed a stateliness of phrase which was marked by clearness and simplicity. Théodore Beza, historian, translator, and dramatist, was another contributor to the literature of this period. Jacques Amyot had commenced his translations from "Ethiopica," treating of the royal and chaste loves of Theagenes and Chariclea three years before Du Bellay's manifesto appeared. Montaigne, referring to his translation of Plutarch, accorded to him the palm over all French writers, not only for the simplicity and purity of his vocabulary, in which he surpassed all others, but for his industry and depth of learning. In another field Michel Eyquem Sieur de Montaigne had arisen. His moral essays found a counterpart in the biographical essays of the Abbé de Brantôme. Agrippa D'Aubigné, prose writer, historian, and poet; Guillaume de Saluste du Bartas, the Protestant Ronsard whose works were more largely translated into English than those of any other French writer; Philippes Desportes and others might be mentioned as forming part of that brilliant circle of writers who had during a comparatively short period helped to achieve such a high position for the language and literature of France.

In 1576, when Francis Bacon arrived in France, the fame of the Pléiade was at its zenith. Du Bellay and Jodelle were dead, but the fruit of their labours and of those of their colleagues was evoking the admiration of their countrymen. The popularity of Ronsard, the prince of poets and the poet of princes, was without precedent. It is said that the King had placed beside his throne a state chair for Ronsard to occupy. Poets and men of letters were held in high esteem by their countrymen. In England, for a gentleman to be amorous of any learned art was held to be discreditable, and any proclivities in this direction had to be hidden under assumed names or the names of others. In France it was held to be discreditable for a gentleman not to be amorous of the learned arts. The young men of the Pléiade were all of good family, and all came from cultured homes. Marguerite of Navarre had set the example of attracting poets and writers to her

Court and according honours to them on account of their achievements. The kings of France had adopted a similar attitude. During the same period in England Henry VIII., Mary, and Elizabeth had been following other courses. They had given no encouragement to the pursuit of literature. Notwithstanding the repetition by historians of the assertion that the good Queen Bess was a munificent patron of men of letters, literature flourished in her reign in spite of her action and not by its aid.

Bacon implies this in the opening sentences of the second book of the "Advancement of Learning." He speaks of Queen Elizabeth as being "a sojourner in the world in respect of her unmarried life, rather than an inhabitant. She hath indeed adorned her own time and many waies enricht it; but in truth to Your Majesty, whom God hath blest with so much Royall issue worthy to perpetuate you for ever; whose youthfull and fruitfull Bed, doth yet promise more children; it is very proper, not only to iradiate as you doe your own times, but also to extend your Cares to those Acts which succeeding Ages may cherish, and Eternity itself behold: Amongst which, if my affection to learning doe not transport me, there is none more worthy, or more noble, than the endowment of the world with sound and fruitfull Advancement of Learning: For why should we erect unto ourselves some few authors, to stand like Hercules Columnes beyond which there should be no discovery of knowledge, seeing we have your Majesty as a bright and benigne starre to conduct and prosper us in this Navigation." As Elizabeth had been unfruitful in her body, and James fruitful, so had she been unfruitful in encouraging the Advancement of Learning, but the appeal is made to James that he, being blessed with a considerable issue, should also have an issue by the endowment of Learning.

What must have been the effect on the mind of this brilliant young Englishman, Francis Bacon, when he entered into this literary atmosphere so different from that of the Court which he had left behind him? There was hardly a classical writer whose works he had not read and re-read. He was familiar with the teachings of the schoolmen; imbued with a deep religious spirit, he had mastered the principles of their faiths and the subtleties of their disputations. The

intricacies of the known systems of philosophies had been laid bare before his penetrating intellect. With the mysteries of mathematics and numbers he was familiar. What had been discovered in astronomy, alchemy and astrology he had absorbed; however technical might be a subject, he had mastered its details. In architecture the works of Vitruvius had been not merely read but criticised with the skill of an expert. Medicine, surgery — every subject — he had made himself master of. In fact, when he asserted that he had taken all knowledge to be his province he spoke advisedly and with a basis of truth which has never until now been recognised. The youth of 17 who possessed the intellect, the brain and the memory which jointly produced the "Novum Organum," whose mind was so abnormal that the artist painting his portrait was impelled to place round it "the significant words," "*si tabula daretur digna, animum mallem*," who had taken all knowledge to be his province, was capable of any achievement of the Admirable Crichton. And this youth it was who in 1576 passed from a country of literary and intellectual torpor into the brilliancy of the companionship of Pierre de Ronsard and his associates. It is one of the most stupendous factors in his life. Something happened to him before his return to England which affected the whole of his future life. It may be considered a wild assertion to make, but the time will come when its truth will be proved, that "The Anatomie of the Minde," "Beautiful Blossoms," and "The French Academy," are the product of one mind, and that same mind produced the "Arte of English Poesie," "An Apology for Poetrie," by Sir John Harrington, and "The Defense of Poetry," by Sir Philip Sydney. The former three were written before 1578 and place the philosopher before the poet; the latter three were written after 1580 and place the poet — the creator — before the philosopher. Francis Bacon had recognised that the highest achievement was the act of creation. Henceforth he lived to create.

Sir Nicholas Bacon died on or about the 17th of February, 1578-9. How or where this news reached Francis is not recorded, but on the 20th of the following March he left Paris for England, after a stay of two and a-half years on the Continent. He brought with him to the Queen a despatch from Sir Amias Paulet,

in which he was spoken of as being “of great hope, endued with many and singular parts,” and one who, “if God gave him life, would prove a very able and sufficient subject to do her Highness good and acceptable service.”[18]

Chapter IX. BACON'S SUIT ON HIS RETURN TO ENGLAND, 1580.

Spedding states that the earliest composition of Bacon which he had been able to discover is a letter written in his 20th year from Grays Inn. From that time forward, he continues, compositions succeed each other without any considerable interval, and in following them we shall accompany him step by step through his life. What are the compositions which Spedding places as being written but not published up to the year 1597, when the first small volume of 10 essays containing less than 6,000 words was issued from the press? These are they: —

Notes on the State of Christendom[19] (date 1580 to 1584).

Letter of Advice to the Queen (1584-1586).

An Advertisement touching the Controversies of the Church of England (1586-1589).

Speeches written for some Court device, namely, Mr. Bacon in praise of Knowledge, and Mr. Bacon's discourse in praise of his Sovereign (1590-1592).

Certain observations made upon a libel published this present year, 1592.

A true report of the Detestable Treason intended by Dr. Roderigo Lopez, 1594.

Gesta Grayorum, 1594, parts of which are printed by Spedding in type denoting doubtful authorship.

Bacon's device, 1594-1598.

Three letters to the Earl of Rutland on his travels, 1595-1596.

That is all! These are the compositions which follow each other without considerable interval, and by which we are to accompany him step by step through those seventeen years which should be the most important years in a man's life! He could have turned them out in ten days or a fortnight with ease. We expect from Mr. Spedding bread, and he gives us a stone!

This brilliant young man, who, when 15 years of age, left Cambridge, having possessed himself of all the knowledge it could afford to a student, who had travelled in France, Spain and Italy to "polish his mind and mould his opinion by intercourse with all kinds of foreigners," how was he occupying himself during what should be the most fruitful years of his life? Following his profession at the Bar? His affections did not that way tend. Spedding expresses the opinion that he had a distaste for his profession, and, writing of the circumstances with which he was surrounded in 1592, says: "I do not find that he was getting into practice. His main object still was to find ways and means for prosecuting his great philosophical enterprise." What was this enterprise? "I confess that I have as vast contemplative ends as I have moderate means," he says, writing to Burghley, "for I have taken all knowledge to be my province." This means more than mere academic philosophy.

In 1593, when Bacon was put forward and upheld for a year as a candidate for the post of Attorney-General, Spedding writes of him; "He had had little or no practice in the Courts; what proof he had given of professional proficiency was confined to his readings and exercises in Grays Inn.... Law, far from being his only, was not even his favourite study; ... his head was full of ideas so new and large that to most about him they must have seemed visionary."

Writing of him in 1594 Spedding says: "The strongest point against Bacon's pretensions for the Attorneyship was his want of practice. His opponents said that 'he had never entered the place of battle.'[20] Whether this was because he could not find clients or did not seek them I cannot say." In order to meet the objection, Bacon on the 25th January, 1593-4, made his first pleading, and Burghley sent his secretary "to congratulate unto him the first fruits of his public practice."

There is one other misconception to be corrected. It is urged that Bacon was, during this period, engrossed in Parliamentary life. From 1584 to 1597 five Parliaments were summoned. Bacon sat in each. In his twenty-fifth year he was elected member for Melcombe, in Dorsetshire. In the Parliament of 1586 he sat

for Taunton, in that of 1588 for Liverpool, in that of 1592-3 for Middlesex, and in 1597 for Ipswich.

But the sittings of these Parliaments were not of long duration, and the speeches which he delivered and the meetings of committees upon which he was appointed would absorb but a small portion of his time. It must be patent, therefore, that Spedding does not account for his occupations from his return to England in 1578 until 1597, when the first small volume of his Essays was published.

During the whole of this period Bacon was in monetary difficulties, and yet there is no evidence that he was living a life of dissipation or even of extravagance. On the contrary, all testimony would point to the conclusion that he was following the path of a strictly moral and studious young man. On his return to England he took lodgings in Coney Court, Grays Inn. There Anthony found him when he returned from abroad.

There are no data upon which to form any reliable opinion as to the amount of his income at this time. Rawley states that Sir Nicholas Bacon had collected a considerable sum of money which he had separated with intention to have made a competent purchase of land for the livelihood of his youngest son, but the purchase being unaccomplished at his death, Francis received only a fifth portion of the money dividable, by which means he lived in some straits and necessities in his younger years. It is not clear whether the "money dividable" was only that separated by Sir Nicholas, or whether he left other sums which went to augment the fund divisible amongst the brothers. His other children were well provided for. Francis was not, however, without income. Sir Nicholas had left certain manors, etc., in Herts to his sons Anthony and Francis in tail male, remainder to himself and his heirs. Lady Ann Bacon had vested an estate called Markes, in Essex, in Francis, and there is a letter, dated 16th April, 1593, from Anthony to his mother urging her to concur in its sale, so that the proceeds might be applied to the relief of his brother's financial position.[21]

Lady Bacon lived at Gorhambury. She was not extravagant, and yet in 1589 she was so impoverished that Captain Allen, in writing to Anthony, speaking of

his mother, Lady Bacon, says she "also saith her jewels be spent for you, and that she borrowed the last money of seven several persons." Whatever her resources were, they had by then been exhausted for her sons. Anthony was apparently a man of considerable means. He was master of the manor and priory of Redburn, of the manor of Abbotsbury, Minchinbury and Hores, in the parish of Barley, in the county of Hertford; of the Brightfirth wood, Merydan-meads, and Pinner-Stoke farms, in the county of Middlesex.[22]

But within a few years after his return to England Anthony was borrowing money wherever he could. Mother and brother appear to have exhausted their resources and their borrowing capabilities. There is an account showing that in eighteen months, about 1593, Anthony lent Francis £373, equivalent to nearly £3,000 at to-day's value. In 1597 Francis was arrested by the sheriff for a debt of £300, for which a money-lender had obtained judgment against him, and he was cast into the Tower. Where had all the money gone? There is no adequate explanation.

The first letter of Francis Bacon's which Spedding met with, to which reference has already been made, is dated 11th July, 1580, to Mr. Doylie, and is of little importance. The six letters which follow — all there are between 1580 and 1590[23] — relate to one subject, and are of great significance. The first is dated from Grays Inn, 16th September, 1580, to Lady Burghley. In it young Francis, now 19 years of age, makes this request: "That it would please your Ladyship in your letters wherewith you visit my good Lord to vouchsafe the mention and recommendation of my suit; wherein your Ladyship shall bind me more unto you than I can look ever to be able to sufficiently acknowledge."

The next letter — written on the same day — is addressed to Lord Burghley. Its object is thus set forth: —

"My letter hath no further errand but to commend unto your Lordship the remembrance of my suit which then I moved unto you, whereof it also pleased your Lordship to give me good hearing so far forth as to promise to tender it unto her Majesty, and withal to add in the behalf of it that which I may better

deliver by letter than by speech, which is, that although it must be confessed that the request is rare and unaccustomed, yet if it be observed how few there be which fall in with the study of the common laws either being well left or friended, or at their own free election, or forsaking likely success in other studies of more delight and no less preferment, or setting hand thereunto early without waste of years upon such survey made, it may be my case may not seem ordinary, no more than my suit, and so more beseeming unto it. As I force myself to say this in excuse of my motion, lest it should appear unto your Lordship altogether undiscreet and unadvised, so my hope to obtain it resteth only upon your Lordship's good affection towards me and grace with her Majesty, who methinks needeth never to call for the experience of the thing, where she hath so great and so good of the person which recommendeth it."

What was this suit? Spedding cannot suggest any explanation. He says: "What the particular employment was for which he hoped I cannot say; something probably connected with the service of the Crown, to which the memory of his father, an old and valued servant prematurely lost, his near relationship to the Lord Treasurer, and the personal notice which he had himself received from the Queen, would naturally lead him to look.... The proposition, whatever it was, having been explained to Burghley in conversation, is only alluded to in these letters. It seems to have been so far out of the common way as to require an apology, and the terms of the apology imply that it was for some employment as a lawyer. And this is all the light I can throw upon it." Subsequently Spedding says the motion was one[24] "which would in some way have made it unnecessary for him to follow 'a course of practice,' meaning, I presume, ordinary practice at the Bar."

Another expression in the letter makes it clear that the object of the suit was an experiment. The Queen could not have "experience of the thing," and Bacon solicited Burghley's recommendation, because she would not need the experience if he, so great and so good, vouched for it.

Burghley appears to have tendered the suit to the Queen, for there is a letter dated 18th October, 1580, addressed to him by Bacon, commencing:

"Your Lordship's comfortable relation to her Majesty's gracious opinion and meaning towards me, though at that time your leisure gave me not leave to show how I was affected therewith, yet upon every representation thereof it entereth and striketh so much more deeply into me, as both my nature and duty presseth me to return some speech of thankfulness."

Spedding remarks thereon: "It seems that he had spoken to Burghley on the subject and made some overture, which Burghley undertook to recommend to the Queen; and that the Queen, who though slow to bestow favours was careful always to encourage hopes, entertained the motion graciously and returned a favourable answer. The proposition, whatever it was, having been explained to Burghley in conversation, is only alluded to in these letters."

Spedding dismisses these three letters in 22 lines of comment, which contain the extracts before set out. He regards the matter as of slight consequence, and admits that he can throw no light upon it. But he points out that it was "so far out of the common way as to require an apology." Surely he has not well weighed the terms of the apology when he says they "imply that it was for some employment as a lawyer."

There had been a conversation between Bacon and Burghley during which Bacon had submitted a project to the accomplishment of which he was prepared to devote his life in the Queen's service. It necessitated his abandoning the profession of the law. Apparently Burghley had remonstrated with him, in the manner of experienced men of the world, against forsaking a certain road and avenue to preferment in favour of any course rare and unaccustomed. Referring in his letter to this, Bacon's parenthetical clause beginning "either being well left or friended," etc., is confession and avoidance. In effect he says: — Few study the common laws who have influence; few at their own free election; few desert studies of more delight and no less preferment; and few devote themselves to that study from their earliest years. Since there are few who, having my opportunities, devote themselves to the study of the common laws, my position

in so doing would not be an ordinary one, no more than is my suit. Therefore, why should I, having your [Burleigh's] influence to help me, sacrifice my great intellectual capabilities fitting me to accomplish my great contemplative ends? Why should I sacrifice them to a study of the common laws?

The sentence may be otherwise construed, but in any case it involves an apology for the abandonment of the profession which had been chosen for him.

The next letter is addressed to the Right Honourable Sir Francis Walsingham, principal secretary to her Majesty, and is dated from Grays Inn, 25th of August, 1585. Spedding's comment on it is as follows: —

"For all this time, it seems, the suit (whatever it was) which he had made to her through Burghley in 1580 remained in suspense, neither granted nor denied, and the uncertainty prevented him from settling his course of life. From the following letter to Walsingham we may gather two things more concerning it: it was something which had been objected to as unfit for so young a man; and which would in some way have made it unnecessary for him to follow 'a course of practice' — meaning, I presume, ordinary practice at the Bar."

This is the letter: —

"It may please your Honour to give me leave amidst your great and diverse business to put you in remembrance of my poor suit, leaving the time unto your Honour's best opportunity and commodity. I think the objection of my years will wear away with the length of my suit. The very stay doth in this respect concern me, because I am thereby hindered to take a course of practice which, by the leave of God, if her Majesty like not my suit, I must and will follow: not for any necessity of estate, but for my credit sake, which I know by living out of action will wear. I spake when the Court was at Theball's to Mr. Vice-Chamberlain,[25] who promised me his furderance; which I did lest he mought be made for some other. If it may please your Honour, who as I hear hath great interest in him, to speak with him in it, I think he will be fast mine."

Spedding remarks: "This is the last we hear of this suit, the nature and fate of which must both be left to conjecture. With regard to its fate, my own conjecture is that he presently gave up all hope of success in it, and tried instead to obtain

through his interest at Court some furtherance in the direct line of his profession."

He adds: "The solid grounds on which Bacon's pretensions rested had not yet been made manifest to the apprehension of Bench and Bar; his mind was full of matters with which they could have no sympathy, and the shy and studious habits which we have seen so offend Mr. Faunt would naturally be misconstrued in the same way by many others."[26]

This passage refers to a letter to Burghley dated the 6th of the following May, *i.e.*, 1586, from which it will be seen that the last had not been heard of the motion. Burghley had been remonstrating with Bacon as to reports which had come to him of his nephew's proceedings. Bacon writes: —

"I take it as an undoubted sign of your Lordship's favour unto me that being hardly informed of me you took occasion rather of good advice than of evil opinion thereby. And if your Lordship had grounded only upon the said information of theirs, I mought and would truly have upholden that few of the matters were justly objected; as the very circumstances do induce in that they were delivered by men that did misaffect me and besides were to give colour to their own doings. But because your Lordship did mingle therewith both a late motion of mine own and somewhat which you had otherwise heard, I know it to be my duty (and so do I stand affected) rather to prove your Lordship's admonition effectual in my doings hereafter than causeless by excusing what is past. And yet (with your Lordship's pardon humbly asked) it may please you to remember that I did endeavour to set forth that said motion in such sort as it mought breed no harder effect than a denial, and I protest simply before God that I sought therein an ease in coming within Bars, and not any extraordinary and singular note of favour."

May not the interpretation of the phrase "I sought therein an ease in coming within Bars" be "I sought in that motion a freedom from the burden (or necessity) of coming within Bars." The phrase "an ease in" is very unusual, and unless it was a term used in connection with the Inns it is difficult to see its

precise meaning. In other words, he sought an alternative method to provide means for carrying out his great philosophical enterprise.

There is an interval of five years before the next and last letter of the six was written. It is undated, but an observation in it shows that it was written when he was about 31 years of age, thus fixing the date at 1591.

From an entry in Burghley's note book,[27] dated 29 October, 1589, it appears that in the meantime a grant had been made to Bacon of the reversion of the office of Clerk to the Counsel in the Star Chamber. This was worth about £1,600 per annum and executed by deputy, but the reversion did not fall in for twenty years, so it did not affect the immediate difficulty in ways and means.

There are occasional references to Francis in Anthony's correspondence which show that the brothers were residing at Grays Inn, but nothing is stated as to the occupation of the younger brother.

At this time, according to Spedding,[28] who, however, does not give his authority, Francis had a lodge at Twickenham. Many of his letters are subsequently addressed from it, and three years later he was keeping a staff of scriveners there.

The last letter is addressed to Lord Burghley, who is in it described by Bacon as "the second founder of my poor estate," and contains the following: —

"I cannot accuse myself that I am either prodigal or slothful, yet my health is not to spend nor my course to get. Lastly, I confess that I have as vast contemplative ends as I have moderate civil ends: for I have taken all knowledge to be my province. This whether it be curiosity or vain glory, or (if one takes it favourably) *philanthropia*, is so fixed in my mind as it cannot be removed. And I do easily see, that place of any reasonable countenance doth bring commandment of more wits than of a man's own, which is the thing I greatly affect. And for your Lordship, perhaps you shall not find more strength and less encounter in any other. And if your Lordship shall find now, or at any time, that I do seek or affect any place, whereunto any that is nearer to your Lordship shall be concurrent, say then that I am a most dishonest man. And if your Lordship will not carry me on, I will not do as Anaxagoras did, who reduced himself with

contemplation unto voluntary poverty; but this I will do, I will sell the inheritance that I have, and purchase some lease of quick revenue, or some office of gain that shall be executed by deputy, and so give over all care of service and become some sorry bookmaker, or a true pioneer in that mine of truth, which he said lay so deep. This which I have writ to your Lordship is rather thoughts than words, being set down without all art, disguising or reservation."

The suit has been of no avail. Once more Bacon appeals (and this is to be his final appeal) to his uncle. He is writing thoughts rather than words, set down without art, disguising or reservation. But if his Lordship will not carry him along he has definitely decided on his course of action. The law is not now even referred to. If the object of the suit was not stated in 1580, there cannot be much doubt now but that it had to do with the making of books and pioneer work in the mine of truth. For ten years Francis Bacon had waited, buoyed up by encouragements and false hopes. Now he decides to take his fortune into his own hands and rely no more on assistance either from the Queen or Burghley.

One sentence in the letter should be noted: "If your Lordship shall find now, or at any time, that I do seek or affect any place whereunto any that is nearer unto your Lordship shall be concurrent, say then that I am a most dishonest man." Surely this was an assurance on Bacon's part that he did not seek or affect to stand in the way of the one — the only one, Robert Cecil — who stood nearer to Burghley in kinship.

It therefore appears evident from the foregoing facts: —

(1) That Francis Bacon at 17 years of age was an accomplished scholar; that his knowledge was abnormally great, and that his wit, memory, and mental qualities were of the highest order — probably without parallel.

(2) That in the year 1580, when 19 years old, he sought the assistance of Burghley to induce the Queen to supply him with means and the opportunity to carry out some great work upon the achievement of which he had set his heart. The work was without precedent, and in carrying it out he was prepared to dedicate to her Majesty the use and spending of his life.

(3) That for ten years he waited and hoped for the granting of his suit, which was rare and unaccustomed, until eventually he was compelled to relinquish it and rely upon his own resources to effect his object.

(4) But he desired to command other wits than his own, and that could be more easily achieved by one holding place of any reasonable countenance. He therefore sought through Burleigh place accompanied by income, so that he might be enabled to achieve the vast contemplative ends he had in view.

(5) That during the years 1580 to 1597, in which he claims that he was not slothful, there is no evidence of his being occupied in his profession or in State affairs to any appreciable extent, and yet there do not exist any acknowledged works as the result of his labours. Rawley states that Bacon would "suffer no moment of time to slip from him without some present improvement."

(6) He received pecuniary assistance from his uncle, Lord Burghley. He strained the monetary resources of his mother and brother, which were not inconsiderable, to the utmost, exhausted his own, and heavily encumbered himself with debts, and yet he was not prodigal or extravagant.

(7) Money and time he must have to carry out his scheme, which, if one takes it favourably, might be termed philanthropia, and he therefore decided that, failing obtaining some sinecure office, he would sell the inheritance he had, purchase some lease of quick revenue or office of gain that could be executed by a deputy, give over all care of serving the State, and become some sorry bookmaker or a true pioneer in the mine of truth.

(8) Spedding says, "He could at once imagine like a poet and execute like a clerk of the works"; but whatever his contemplative ends were there is nothing known to his biographers which reveals the result of his labours as clerk of the works.

(9) If he carried out the course of action which he contemplated it is clear that he decided to do so without himself appearing as its author and director. From 1580 to 1590 something more was on his mind than the works he published after he had arrived at sixty years of age. "I am no vain promiser," he said. Where can the fulfilment of his promise be found? Can his course be followed by tracing

through the period the trail which was left by some great and powerful mind directing the progress of the English Renaissance?

Chapter X. THE RARE AND UNACCUSTOMED SUIT.

What was this rare and unaccustomed suit of which the Queen could have had no experience and which, according to Spedding, would make it unnecessary for Bacon to follow “ordinary practice at the bar”? Historians and biographers have founded on this suit the allegation that from his earliest years Bacon was a place hunter, entirely ignoring the fact, which is made clear from the letter to Walsingham written four years after the application was first made, that he had resolved on a course of action which, if her Majesty liked not his suit, by the leave of God he must and would follow, not for any necessity of estate, but for his credit sake. Here was a young man of twenty years of age, earnestly urging the adoption of a scheme which he had conceived, and which he feared Burghley might consider indiscreet and unadvised. Failing in obtaining his object, as will be proved by definite evidence, undertaking at the cost of Thomas Bodley and other friends a course of travel to better fit him for the task he had mapped out as his life’s work — returning to England and, four years after his first request had been made, renewing his suit — grimly in earnest and determined to carry the scheme through at all costs, with or without the Queen’s aid. This is not the conduct of a mere place hunter. If these letters be read aright and the reasonable theory which will be advanced of the nature of the suit be accepted — all efforts to suggest any explanation having hitherto, as Spedding admits, proved futile — a fresh light will be thrown upon the character of Francis Bacon, and the heavy obligation under which he has placed his countrymen for all ages will for the first time be recognised.

In the seven volumes of “Bacon’s Life and Letters” there is nothing to justify the eulogy on his character to which Spedding gave utterance in the following words:— “But in him the gift of seeing in prophetic vision what might be and ought to be was united with the practical talent of devising means and handling minute details. He could at once imagine like a poet and execute like a clerk of

the works. Upon the conviction *This must be done* followed at once *How* may it be done? Upon that question answered followed the resolution to try and do it." But although Spedding fails to produce any evidence to justify his statement, it is nevertheless correct. More than that, the actual achievement followed with unerring certainty, but Spedding restricts Bacon's life's work to the establishment of a system of inductive philosophy, and records the failure of the system.

William Cecil was a man of considerable classical attainments, although these were probably not superior to those of Mildred Cooke, the lady who became his second wife. He was initiated into the methods of statesmanship at an early age by his father, Richard Cecil, Master of the Robes to Henry VIII. Having found favour with Somerset, the Protector of Edward VI., he was, when 27 years of age, made Master of Requests. When Somerset fell from power in 1549 young Cecil, with other adherents of the Protector, was committed to the Tower. But he was soon released and was rapidly advanced by Northumberland. He became Secretary of State, was knighted and made a member of the Privy Council. Mary would have continued his employment in office had he not refused her offers on account of his adhesion to the Protestant faith. He mingled during her reign with men of all parties and his moderation and cautious conduct carried him through that period without mishap. On Elizabeth's accession he was the first member sworn upon the Privy Council, and he continued during the remainder of his life her principal Minister of State. Sagacious, deliberate in thought and character, tolerant, a man of peace and compromise, he became the mainstay of the Queen's government and the most influential man in State affairs. Whilst he maintained a princely magnificence in his affairs, his private life was pure, gentle and generous. This was the man to whom the brilliant young nephew of his wife and the son of his old friend, Sir Nicholas Bacon, disclosed, some time during the summer of 1580, his scheme, of which there had been no experience, and entrusted his suit, which was rare and unaccustomed. The arguments in its favour at this interview may have followed the following outline: —

I need not remind you of my devotion to learning. You know that from my earliest boyhood I have followed a course of study which has embraced all subjects. I have made myself acquainted with all knowledge which the world possesses. To enable me to do this I mastered all languages in which books are written. During my recent visit to foreign lands, I have recognized how far my country falls behind others in language, and consequently in literature. I would draw your special attention to the remarkable advance which has been made in these matters in France during your lordship's lifetime. When I arrived there in 1576 I made myself acquainted with the principles of the movement which had been carried through by Du Bellay, Ronsard, and their confrères. They recognized that their native language was crude and lacking in gravity and art. First by obtaining a complete mastery of the Greek and Latin languages, as also of those of Italy and Spain, they prepared themselves for a study of the literatures of which those languages, with their idioms and peculiarities, form the basis. Having obtained this mastery they reconstructed their native language and gave their country a medium by which her writers might express their thoughts and emotions. They have made it possible for their countrymen to rival the poets of ancient Greece and Rome. They and others of their countrymen have translated the literary treasures of those ancient nations into their own tongue, and thereby enabled those speaking their language, who are not skilled in classical languages, to enjoy and profit by the works of antiquity. Your lordship knows well the deficiencies of the language of our England, the absence of any literature worthy of the name. In these respects the condition of affairs is far behind that which prevailed in France even before the great movement which Ronsard and Du Bellay initiated. I do not speak of Italy, which possesses a language melodious, facile, and rich, and a literature which can never die.

I know my own powers. I possess every qualification which will enable me to do for my native tongue what the Pléiade have done for theirs. I ask to be permitted to give to my country this great heritage. Others may serve her in the law, others may serve her in affairs of state, but your Lordship knows full well that there are none who could serve her in this respect as could I. You are not

unmindful of the poorness of my estate. This work will not only entail a large outlay of money but it necessitates command of the ablest wits of the nation. This is my suit: that her Majesty will graciously confer on me some office which will enable me to control such literary resources and the services of such men as may be necessary for the accomplishment of this work; further, that she may be pleased from time to time to make grants from the civil list to cover the cost of the work. I need not remind your Lordship what fame will ever attach to her Majesty and how glorious will be the memory of her reign if this great project be effected in it. Your Lordship must realise this because you and her Ladyship, my aunt, are by your attainments qualified to appreciate its full value. My youth may be urged as an objection to my fitness for such a task, but your Lordship knows full well — none better — that my powers are not to be measured by my years. This I will say, I am no vain promiser, but I am assured that I can accomplish all that I contemplate. The Queen hath such confidence in the soundness of your judgment that she will listen to your advice. My prayer to you therefore is that it may please your Lordship both herein and elsewhere to be my patron and urge my suit, which, although rare and unaccustomed, may be granted if it receives your powerful support.

The suit was submitted to the Queen, but without result. Probably it was not urged with a determination to obtain its acceptance in spite of any objections which might be raised by the Queen. Five years after, Bacon, still a suppliant, wrote to Walsingham: “I think the objection to my years will wear away with the length of my suit.” Cautious Lord Burghley would give full weight to the force of this objection if it were advanced by the Queen. He loved this boy, with his extraordinary abilities, but he had such novel and far-reaching ideas. He appeared to have no adequate reverence for his inferior superiors. On leaving Cambridge he had arrogantly condemned its cherished methods of imparting knowledge. Before power was placed in his hands the use he might make of it must be well weighed and considered. What effect might the advancement of Francis Bacon have on Robert Cecil’s career? Granted that the contentions of the former were sound, and the object desirable, should not this work be carried out

by the Universities? Never leap until you know where you are going to alight was a proverb the soundness of which had been proved in Lord Burghley's experience. What might be the outcome if this rare and unaccustomed suit were granted? Better for the Queen, who, though slow to bestow favours, was always ready to encourage hopes, to follow her usual course. She might entertain the motion graciously and return a favourable answer and let it rest there. And so it did.

Then there was a happening which has remained unknown until now.

Chapter XI. BACON'S SECOND VISIT TO THE CONTINENT AND AFTER.

In the "Reliquiæ Bodleianæ," published in 1703, is a letter written without date by Thomas Bodley to Francis Bacon. This letter does not appear to have been known to Mallett, Montague, Dixon, Spedding, or any of Bacon's biographers. It had been lost sight of until the writer noticed it and reproduced it in *Baconiana*. This is the letter: —

My Dear Cousin, — According to your request in your letter (dated the 19th October at Orleans, I received here the 18th of December), I have sent you by your merchant £30 (the thirty is written thus 30 l) sterling for your present supply, and had sent you a greater sum, but that my extraordinary charge this year *hath utterly unfurnished me*. And now, cousin, though I will be no *severe* exactor of the account, either of your money or time, yet for the love I bear you, I am very desirous, both to satisfy myself, and your friends how you prosper in your travels, and how you find yourself bettered thereby, either in knowledge of God, or of the world; the rather, because the Days you have already spent abroad, are now both sufficient to give you Light, how to fix yourself and end with counsel, and accordingly to shape your course constantly unto it. Besides, it is a vulgar scandal unto the travellers, that few return more religious (narrow, *editor*) than they went forth; wherein both my hope and Request is to you, that your principal care be to hold your Foundation, and to make no other use of informing your self in the corruptions and superstitions of other nations, than only thereby to engage your own heart more firmly to the Truth. You live indeed in a country of two several professions, and you shall return a Novice, if you be not able to give an account of the Ordinances, strength, and progress of each, in Reputation, and Party, and how both are supported, ballanced and managed by the state, as being the contrary humours, in the Temper of Predominancy whereof, the Health or Disease of that Body doth consist. These things you will observe, not only as an *English*-man, whom it may concern, to what interest his

country may expect in the consciences of their Neighbours; but also, as a Christian, to consider both the beauties and blemishes, the hopes and dangers of the *church* in all places. Now for the world, I know it *too* well, to persuade you to dive into the practices thereof; rather stand upon your own guard, against all that attempt you there unto, or may practise upon you in your Conscience, Reputation, or your Purse. Resolve, no Man is wise or safe, but he that is honest: And let this Persuasion turn your studies and observations from the Complement and Impostures of the debased age, to more real grounds of wisdom, gathered out of the story of Times past, and out of the government of the present state. Your guide to this, is the knowledge of the country and the people among whom ye live; For the country though you cannot see all places, yet if, as you pass along, you enquire carefully, and further help yourself with Books that are written of the cosmography of those parts, you shall sufficiently gather the strength, Riches, Traffick, Havens, Shipping, *commodities*, vent, and the wants and disadvantages of places. Wherein also, for your good hereafter, and for your friends, it will befit to note their buildings, Furnitures, Entertainments; all their Husbandry, and ingenious inventions, in whatsoever concerneth either Pleasure or Profit.

For the people, your traffick among them, while you learn their language, will sufficiently instruct you in their Habilities, Dispositions, and Humours, if you a little enlarge the Privacy of your own Nature, to seek acquaintance with the best sort of strangers, and *restrain* your *Affections* and Participation, for your own countrymen of whatsoever condition.

In the story of France, you have a *large and pleasant Field* in three lines of their Kings, to observe their alliances and successions, their *Conquests*, their wars, *especially with us*; their Councils, their treaties; and all Rules and examples of experiences and Wisdom, which may be Lights and Remembrances to you hereafter, to Judge of all occurants both at home and abroad.

Lastly, for the Government, your end *must not be like an* Intelligencer, to spend all your time in fishing after the present News, Humours, Graces, *or* Disgraces of Court, which happily may change before you come home; but your

better and more constant ground will be, to know the Consanguinities, Alliances, and Estates of their Princes; Proportion between the Nobility and Magistracy; the Constitutions of their Courts of Justice; the state of the Laws, as well for the making as the execution thereof; How the Sovereignty of the King infuseth itself into all Acts and Ordinances; how many ways they lay Impositions and Taxations, and gather Revenues to the *Crown*.

What be the Liberties and Servitudes of all degrees; what Discipline and Preparations for wars; what Invention for increase of Traffick at home, for multiplying their commodities, encouraging Arts and Manufactures, or of worth in any kind. Also what establishment, to prevent the *Necessities* and *Discontentment* of *People*, To cut off suits at Law, and Duels, to suppress thieves and all Disorders.

To be short, because my purpose is not to bring all your Observations to Heads, but only by these few to let you know what manner of Return your Friends expect *from you*; let me, for all these and all the rest, give you this one Note, which I desire you to observe as the Counsels of a Friend, *Not* to spend your Spirits, and the *precious* time of your Travel, in a Captious Prejudice and censuring of all things, nor in an Infectious Collection of base Vices and Fashions of Men and Women, or general corruption of these times, which will be of use only Among Humorists, for Jests and Table-Talk: but rather strain your Wits and Industry soundly to instruct yourself in all things between *Heaven and Earth* which may tend to Virtue, Wisdom, and Honour, and which may make your life more profitable to your country, and yourself more comfortable to your friends, and acceptable to God. And to conclude, let all these Riches be treasured up, not only in your memory, where time may lessen your stock; but rather in good writings, and Books of Account, which will *keept* them safe for your use hereafter.

And if in this time of your liberal Traffick, you will give me any advertizement of your commodities in these kinds, I will make you as liberal a Return from my self and your Friends here, as I shall be able.

And so commending all your good Endeavours, to him that must either *wither* or *prosper* them, I very kindly bid you farewel.

Your's to be commanded,

Thomas Bodley.

Spedding prints this letter (Vol. II. p. 16) commencing with the words, "Yet for the love I bear," to the end, with the exception of the last sentence, as a letter written probably by Bacon for Essex to send to the Earl of Rutland. He identifies it as "the letter which the compiler of Stephens' Catalogue took for a letter addressed by Bacon to Buckingham," which he says it could not be. The original is at Lambeth (MSS. 936, fo. 218). The seal remains, but the part of the last sheet which contained the signature on one side, and the superscription on the other, has been torn off. The letter commences, "*My good Lord*," and ends, "*Your Lordship's in all duty to serve you*." It would appear, therefore, that someone had access to Bodley's letter to Bacon, and, approving its contents, used its contents a second time.

There are two palpable deductions to be drawn from this letter: (1) That Bacon was on a journey through *several* countries to obtain knowledge of their customs, laws, religion, military strength, shipping, and whatsoever concerneth pleasure or profit. There is a striking correspondence between Bodley's advice and the description of Bacon's travels found in the "Life" prefixed to "L'Histoire Naturelle." (2) That Bacon was being supported by Bodley and other of his friends, who desired him to keep a record of all that he observed and learnt, and to report from time to time as he progressed, and in return, said Bodley, "I will make you as liberal a return from myself and your friends here as I shall be able." This letter was written from England, and there is a paragraph in Bodley's "Life," written by himself, which makes it possible to fix the year: —

"My resolution fully taken I departed out of England anno 1576 and continued very neare foure yeares abroad, and that in sundry parts of Italy, France, and Germany. A good while after my return to wit, in the yeare 1585 I was employed by the Queen," *etc.*

If this letter was written between 1576 and 1579 it would appear strange that Bodley and others should be providing Bacon with money for his travels, and requiring reports from him, whilst his father, Sir Nicholas Bacon, was alive and prosperous. No such difficulty, however, arises, for the letter, being sent from England, could not have been written between the date of Bacon's first departure for France in 1576 and his return on his father's death in 1579, for during the whole of that time Bodley was abroad. It is stated in it that Bacon wrote from Orleans a letter dated 19th October, the year not being given. This could not be in 1580, for Bacon wrote to Lord Burghley from Gray's Inn on the 18th October, 1580. Spedding commences the paragraph immediately following this letter by saying, "From this time we have no further news of Francis Bacon till the 5th of April, 1582," and although he does not reproduce the letter, he relies on a letter from Faunt to Anthony Bacon, to which that date is attributed in Birch's " Memorials," Vol. I. page 22. In it Faunt refers to having seen Anthony's mother and his brother Francis. Faunt left Paris for England on the 22nd March, 1582. This letter was written on the 15th of the following month, so no trace has been found of Francis being in England between 18th October, 1580, and 5th of April, 1582. Bodley's letter, must, therefore, have been written in December, 1581, when Bacon was abroad making a journey through several countries. From the foregoing facts it is impossible to form any other conclusion. Now for the first time this journey has been made known. There is a letter amongst the State papers in the Record Office, dated February, 1581, written by Anthony Bacon to Lord Burghley, enclosing a note of advice and instructions for his brother Francis. Anthony was an experienced traveller, and was then abroad. It reads as though he was sending advice and instructions to his younger brother, who was about to start on travels through countries with which Anthony was familiar. If so, Francis would leave England early in March, 1581 — that is, if he had not left before this letter was received by Burghley.

Having established beyond reasonable doubt the fact of this journey, a new and remarkable suggestion presents itself. Spedding, when dealing with the year

1582, prints “Notes on the State of Christendom,”[29] with the following remarks: —

“If that paper of notes concerning ‘The State of Europe’ which was printed as Bacon’s in the supplement to Stephens’ second collection in 1734, reprinted by Mallet in 1760, and has been placed at the beginning of his political writings in all editions since 1563, be really of his composition, this is the period of his life to which it belongs. I must confess, however, that I am not satisfied with the evidence or authority upon which it appears to have been ascribed to him.”

Robert Stephens, who was Historiographer Royal in the reign of William and Mary, states that the Earl of Oxford placed in his hands some neglected manuscripts and loose papers to see whether any of the Lord Bacon’s compositions lay concealed there and were fit for publication. He found some of them written, and others amended, with his lordship’s own hand. He found certain of the treatises had been published by him, and that others, certainly genuine, which had not, were fit to be transcribed if not divulged. Spedding states that he has little doubt that this paper on the state of Europe was among these manuscripts and loose papers, for the editor states that the supplementary pieces (of which this was one) were added from originals found among Stephens’ papers. The original is now among the Harleian MSS. in the British Museum. Spedding thus describes it: —

“The Harleian MS. is a copy in an old hand, probably contemporary, but not Francis Bacon’s. A few sentences have been inserted afterwards by the same hand, and two by another which is very like Anthony Bacon’s; none in Francis’s. The blanks have all been filled up, but no words have been corrected, though it is obvious that in some places they stand in need of correction.

“Certain allusions to events then passing (which will be pointed out in their place) prove that the original paper was written, or at least completed, in the summer of 1582, at which time Francis Bacon was studying law in Gray’s Inn, while Anthony was travelling in France in search of political intelligence and was in close correspondence with Nicholas Faunt, a secretary of Sir Francis Walsingham’s, who had spent the previous year in France, Germany,

Switzerland, and the north of Italy, on the same errand; and was now living about the English Court, studying affairs at home, and collecting and arranging the observations which he had made abroad, 'having already recovered all his writings and books which he had left behind him in Italy and in Frankfort' (see Birch's 'Memoirs,' I. 24), and it is remembered that if this paper belonged to Anthony Bacon, it would naturally descend at his death to Francis and so remain among his manuscripts, where it is supposed to have been found.

"Thus it appears that the external evidence justifies no inference as to the authorship, and the only question is whether the *style* can be considered conclusive. To me it certainly is not. But as this is a point upon which the reader should be allowed to judge for himself, and as the paper is interesting in itself and historically valuable and has always passed for Bacon's, it is here printed from the original though (to distinguish it from his undoubted compositions) in a smaller type."

Spedding's difficulty in accepting this paper as from Bacon's pen really lay in the fact that from the internal evidence it is obvious that it was written by one who had himself travelled through, at any rate, some of the countries described. The results of personal observation are again and again apparent. According to Spedding, Bacon was in 1581-1582 studying law at Gray's Inn; according to Bodley he was on the Continent making observations for his future guidance. The reader can judge of the value of the external evidence. It is not conclusive, but the draft being found amongst papers which were unquestionably Bacon's writings and being adopted as Bacon's and published as such by those who found it, the balance of probabilities is distinctly in favour of its being his. As to the internal evidence much may be said. It corresponds as closely as it is possible with Bodley's requirements as set forth in his letter of December. It is exactly "the manner of return" Bodley wrote to Francis "your friends expect from you." "And," he added, "if in this time of your liberal Traffick, you will give me any advertisement of your commodities in these kinds, I will make you as liberal a return from myself and your friends here as I shall be able."

The date agrees with that of Bacon's second visit to the Continent. In Spedding's Life and Letters it occupies twelve and a-half pages, of which five are occupied by descriptions of Italy, one of Austria, two of Germany (chiefly a recital of names and places), two of France, three-quarters of Spain, one and three-quarters of Portugal, Poland, Denmark, and Sweden. This may have been Bacon's itinerary in 1581-2.

Italy is treated with considerable detail and was undoubtedly described from personal observation, as were France and Spain. In a less degree the description of Austria, Poland and Denmark produces this impression; in a still smaller degree Portugal and Sweden, and it is quite absent from the description of Germany. Florence, Venice, Mantua, Genoa, Savoy, are dealt with in most detail. Rawley states that it was Bacon's intention to have stayed abroad some years longer when he was called home by the death of his father, to find himself left in straightened circumstances. Then followed his ineffectual suit, which he still persisted in. Bodley evidently was, if not the instigator, at any rate the paymaster for this second journey. Anthony's letter of February, 1581, points to Burghley as a participator in the project. He would assist not only out of kindly feeling, but the journey would at any rate get this ambitious, determined young man out of the way for a time, and possibly the journey might get this unaccustomed suit out of his mind. Thus it came about.

From Faunt's letters, Spedding says we derive what little information we have with regard to Francis's proceedings from 1583 to 1584. "From them we gather little more than that he remained studying at Gray's Inn, occasionally visiting his mother at Gorhambury, or going with her to hear Travers at the Temple and occasionally appearing at the Court."

But the suit was not abandoned, for there is the letter of 25th August, 1585, to Walsingham, when Bacon writes: "I think the objection of my years will wear away with the length of my suit. The very stay doth in this respect concern me, because I am thereby hindered to take a course of practice which by the leave of God, if her Majesty like not of my suit, I must and will follow: not for any

necessity of estate, but for my credit sake, which I know by living out of action will wear."

Again, the old, "rare and unaccustomed suit" of which the Queen could have had no experience! Either the persuasive powers of Burghley had failed or he had not exerted them. Probably the latter, because the troublesome, determined young man is now worrying Walsingham and Hatton to urge its acceptance with the Queen. The purport of the foregoing extract effectually precludes the possibility of this suit referring to his advancement at the bar. For five years it has been proceeding — he has been indulging in hopes which have been unfulfilled. Now he will wait no longer, but he will adopt a course which, if her Majesty like not his suit, by the leave of God he must and will follow, not for any necessity of making money but because he feels impelled to it by a sense of responsibility which he must fulfil. Walsingham and Hatton do not appear to have helped the matter forward. There was little probability of them succeeding in influencing the Queen where Burghley had failed. There was still less probability of them attempting to influence her if Burghley objected. Had this suit referred to advancement in the law it would have been granted with the aid of Burghley's influence years before. Had it referred to some ordinary office of State, friends so powerful as Burghley, Walsingham and Hatton could and would have obtained anything within reason for this brilliant young son of Sir Nicholas Bacon, for there was no complication with Essex until after 1591. But this rare and unaccustomed suit of which there had been no experience was another matter.

Six more years pass, and although there is now no suit to the Queen there is the same idea prevailing in the letter to Burghley — a seeking for help to achieve some great scheme upon which Bacon's mind was so fixed "as it cannot be removed," "whether it be curiosity, vainglory or nature, or (if one take it favourably) philanthropia." Still he required the command of more wits than of a man's own, which is the thing he did greatly affect. Still his course was not to get. Still the determination to achieve the object without help, if help could not be obtained — to achieve it by becoming some sorry bookmaker or a pioneer in

that mine of truth which Anaxagoras said lay so deep. This is emphasised. These are “thoughts rather than words, being set down without all art, disguising or reservation.”

There are two significant sentences in this letter written to Burghley when Bacon was 31 years of age. He describes Burghley as “the second founder of my poor estate,” and, further, he uses the expression “And if your Lordship will not carry me on.” What can these allusions mean but that Burghley had been rendering financial assistance to his nephew? If the theory here put forward as to the nature of the suit be correct, the object was one which would have Burghley’s cordial support. That he had expressed approval of it must be deduced from the letter of the 16th of September, 1580. The object was one which, without doubt, would find still warmer support from Lady Mildred. But the suit was so unprecedented that it is not to be wondered at that Burghley did not try to force it through. The work was going forward all the time — slowly for lack of means and official recognition. Burghley, generous in his nature, lavish in private life, might, however, be expected to help a work which he would be glad to see carried to a successful conclusion.

Had he been less cautious and let young Francis have his head, what might not have happened! But there was always the fear of letting this huge intellectual power forge ahead without restraint. It was, however, working out unseen its scheme and that, too, with Burghley’s help and that of others. The period from 1576 to 1623 — only 47 years — sees the English language developed from a state of almost barbaric crudeness to the highest pitch which any language, classical or modern, has reached. There was but one workman living at that period who could have constructed that wonderful instrument and used it to produce such magnificent examples of its possibilities. It is as reasonable to take up a watch keeping perfect time and aver that the parts came together by accident, as to contend that the English language of the Authorised Version of the Bible and the works of Shakespeare were the result of a general up-springing of literary taste which was diffused amongst a few writers of very mediocre ability. The English Renaissance was conceived in France and born in England

in 1579. It ran its course and in 1623 attained its maturity; but when Francis Bacon was no more — he who had performed that in our tongue which may be preferred either to insolent Greece or haughty Rome— “things daily fall, wits grow downward, and eloquence grows backward: so that he may be named and stand as the mark and ἀχμή of our language.”

Chapter XII. IS IT PROBABLE THAT BACON LEFT MANUSCRIPTS HIDDEN AWAY?

It is difficult to leave this subject without some reference to the articles which have appeared in the press and magazines referring to the suggestion that there were left concealed literary remains of Bacon hitherto undiscovered.

In an article which recently appeared in a Shakespearean journal, a writer who evidently knows little about the Elizabethan period said: “But why should Bacon want to bury manuscripts, anyhow? Who does bury manuscripts? Besides, they had been printed and were, therefore, rubbish and waste paper merely.” The manuscript of John Harrington’s translation of Ariosto’s “Orlando Furioso” may be seen in the British Museum. It is beautifully written on quarto paper. It was, apparently, the fair copy sent to the printer from which the type was to be set up. Be this as it may, it was undoubtedly a copy upon which Bacon marked off the verses which are to go on each page and set out the folio of each page and the printer’s signature which was to appear at the bottom. It also contains instructions to the printer as to the type to be used. This manuscript was not considered “rubbish and waste paper merely.”

Francis Bacon has again and again insisted upon the value of history. In the “Advancement of Learning” he points out to the King “the indignity and unworthiness of the history of England as it now is, in the main continuation thereof.” No man appreciated as did Bacon the importance in the history of England of the epoch in which he lived. That a truthful relation of the events of those times would be invaluable to posterity he knew full well. He of all men living at that time was best qualified to write such a history. He recognised that there were objections to a history being written, or, at any rate, published, wherein the actions of persons living were described, for he said “it must be confessed that such kind of relations, specially if they be published about the times of things done, seeing very often that they are written with passion or partiality, of all other narrations, are most suspected.” It is hardly conceivable

that Bacon should have failed to provide a faithful history of his own times for the benefit of posterity, or, at any rate, that he should have failed to preserve the materials for such a history. Neither the history nor such materials are known to be in existence. Supposing Bacon had prepared either the one or the other, what could he do with it? Hand it to Rawley with instructions for it to be printed? With a strong probability, if it were a faithful history, that it would never be published, but that it would be destroyed, he would never take such a risk. There would only be one course open to him. To conceal it in some place where it would not be likely to be disturbed, in which it might remain in safety, possibly for hundreds of years. And then leave a clue either in cypher or otherwise by which it might be recovered.

It is by no means outside the range of possibility that Bacon as early as 1588 had opened a receptacle for books and manuscripts which he desired should go down to posterity, and fearing their loss from any cause, he carefully concealed them, adding to the store from time to time. If he did so he left a problem to be solved, and arranged the place of concealment so that it could only be found by a solution of the problem.

The emblems on two title-pages of two books of the period are very significant. "Truth brought to Light and discovered by Time" is a narrative history of the first fourteen years of King James' reign. One portion of the engraved title-page represents a spreading tree growing up out of a coffin, full fraught with various fruits (manuscripts and books) most fresh and fair to make succeeding times most rich and rare. In the Emblem (Fig. III.) now reproduced, which is found on the title-page of the first edition of "New Atlantis," 1627,[30] Truth personified by a naked woman is being revealed by Father Time, and the inscription round the device is "*Tempore patet occulta veritas* — in time the hidden truth shall be revealed."

Then, in further confirmation of this view, there is the statement of Rawley in his introduction to the "Manes Verulamiani." Speaking of the fame of his illustrious master he says, "Be this moreover enough, to have laid, as it were, the foundations, in the name of the present age. Every age will, methinks, adorn and

amplify this structure, but to what age it may be vouchsafed to set the finishing hand — this is known only to God and the Fates."

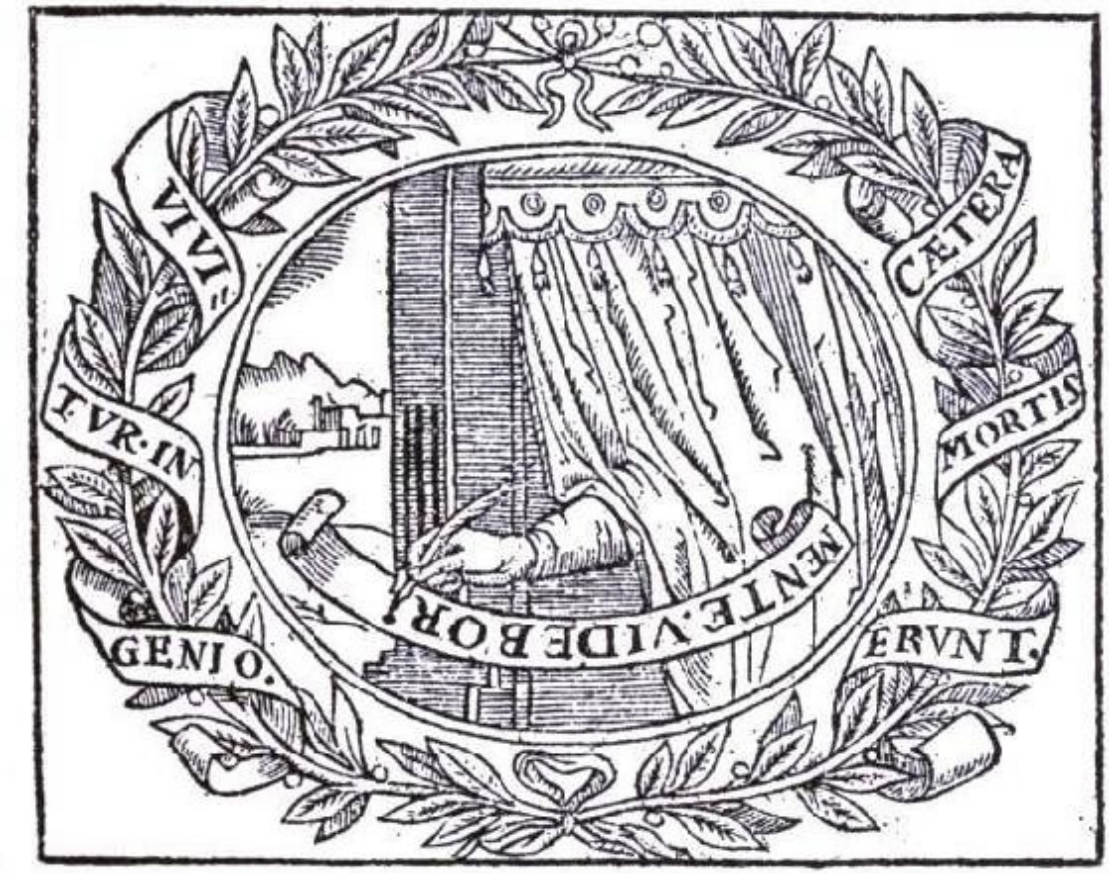

Fig. IV.

From the Title Page of Peacham's "Minerva Britannia," 1612.

Chapter XIII. HOW THE ELIZABETHAN LITERATURE WAS PRODUCED.

The half century from 1576 to 1625 stands by itself in the history of the literature of this country. During that period not only was the English language made, not only were there produced the finest examples of its capacities, which to-day exist, but the knowledge and wisdom possessed by the classical writers, the histories of the principal nations of the world, practically everything that was worth knowing in the literature which existed in other countries were, for the first time, made available in the English tongue. And what is still more remarkable, these translations were printed and published. These works embraced every art and subject which can be imagined. Further, during this period there were issued a large number of books crowded with information upon general subjects. The names on the title-pages of many of these works are unknown. It is astonishing how many men as to whom nothing can be learnt, appear about this time to have written one book and one book only.

These translations were published at a considerable cost. For such works, being printed in the English language, purchasers were practically confined to this country, and their number was very limited. The quantity of copies constituting an edition must have been small. It is impossible to believe that the sale of these books could realise the amount of their cost.

Definite information on this point is difficult to obtain, for little is known as to the prices at which these books were sold.

It appears from the “Transcripts of the Stationers’ Registers” that the maximum number of copies that went to make up an edition was in the interest of the workman fixed at 1,250 copies, so that if a larger number were required the type had to be re-set for each additional 1,250 copies. Double impressions of 2,500 were allowed of primers, catechisms, proclamations, statutes and almanacs. But the solid literature which came into the language at this period would not be required in such quantities. The printer was not usually the vendor

of the books. The publisher and bookseller or stationer carried on in most cases a distinct business.

Pamphlets, sermons, plays, books of poems, formed the staple ware of the stationer. The style of the book out of which the stationer made his money may be gathered from the following extract from *The Return from Parnassus*, Act I, scene 3: —

Ingenioso. — Danter thou art deceived, wit is dearer than thou takest it to bee. I tell thee this libel of Cambridge has much salt and pepper in the nose: it will sell sheerely underhand when all those bookes of exhortations and catechisms lie moulding on thy shopboard.

Danter. — It's true, but good fayth, M. Ingenioso, I lost by your last booke; and you know there is many a one that pays me largely for the printing of their inventions, but for all this you shall have 40 shillings and an odde pottle of wine.

Ingenioso. — 40 shillings? a fit reward for one of your reumatick poets, that beslavers all the paper he comes by, and furnishes the Chaundlers with wast papers to wrap candles in: ... it's the gallantest Child my invention was ever delivered off. The title is, a Chronicle of

Cambridge Cuckolds; here a man may see, what day of the moneth such a man's commons were inclosed, and when throwne open, and when any entayled some odde crownes upon the heires of their bodies unlawfully begotten; speake quickly, ells I am gone.

Danter. — Oh this will sell gallantly. Ile have it whatsoever it cost, will you walk on, M. Ingenioso, weele sit over a cup of wine and agree on it.

The publication of such works as Hollingshed's "Chronicles," North's "Plutarch's Lives," Grimston's "History of France," and "The French Academy," could not have been produced with profit as the object. A large body of evidence may be brought forward to support this view, but space will only permit two examples to be here set forth.

In the dedication to Sir William Cecil, of Hollingshed's "Chronicles," 1587, the writer says:

Yet when the volume grew so great as they that were to defraie the charges for the impression were not willing to go through with the whole, they resolved first to publish the histories of England, Scotland, and Ireland with their descriptions.

John Dee spent most of the year 1576 in writing a series of volumes to be entitled "General and Rare Memorials pertayning to the perfect Art of Navigation." In 1577 the first volume was ready for the press. In June he had to borrow £40 from one friend, £20 from another, and £27 upon "the chayn of gold." In the following August John Day commenced printing it at his press in

Aldersgate. The title was “The British Monarchy or Hexameron Brytannicum,” and the edition consisted of 100 copies.

The second volume, “The British Complement,” was ready in the following December. It was never published. Dee states in his Diary that the printing would cost many hundreds of pounds, as it contained tables and figures, and he must first have “a comfortable and sufficient opportunity or supply thereto.” This he was unable to procure, so the book remained in manuscript.[31]

Books of this class were never produced with the object of making profit. The proceeds of sale would not cover the cost of printing and publishing, without any provision for the remuneration of the translator or author. Why were they published, and how was the cost provided?

There was, however, another source of revenue open to the author of a book. Henry Peacham, in “The Truth of our Time,” says: —

“But then you may say, the Dedication will bee worth a great matter, either in present reward of money, or preferment by your Patrones Letter, or other means. And for this purpose you prefixe a learned and as Panegyricall Epistle as can,” *etc.*

It is beyond question that an author usually obtained a considerable contribution towards the cost of the production of a book from the person to whom the dedication was addressed. A number of books published during the period from 1576 to 1598 are dedicated to the Queen, to the Earl of Leicester, and to Lord Burghley. One can only offer a suggestion on this point which may or may not be correct. If Francis Bacon was concerned in the issue of these translations and other works, and Burghley was assisting him financially, it is probable that Burghley would procure grants from the Queen in respect of books which were dedicated to her, and would provide funds towards the cost of such books as were dedicated to himself. “The Arte of English Poesie” was written with the intention that it should be dedicated to the Queen, but there was a change in the plans, and Burghley’s name was substituted. When Bacon, in 1591, is threatening to become “a sorry bookmaker,” he describes Burghley as the second founder of his poor estate, and uses the expression, “If your Lordship

will not carry me on," which can only mean that as to the matter which is the subject of the letter, Burghley had not merely been assisting but carrying him. The evidence which exists is strong enough to warrant putting forward this theory as to the frequency of the names of the Queen and Burghley on the dedications.

The Earl of Leicester desired to have the reputation of being a patron of the arts, and was willing to pay for advertisement. He was the Chancellor of Oxford University, and evidently recognised the value of printing, for in 1585 he erected, at his own expense, a new printing press for the use of the University. If he paid at all for dedications he would pay liberally. But, of course, the Queen, Burghley, and Leicester were accessible to others besides Bacon, and the argument goes no further than that towards the production of certain books upon which their names appear the patrons provided part of the cost. The recognition of this fact, however, does not detract from the importance of the expressions used by Bacon in his letter to Burghley.

There is abundant testimony to the fact that it was the custom, during the Elizabethan age, for an author to suppress his own name, and on the title-page[32] substitute either the initials or name of some other person. The title-pages of this period are as unreliable as are the names or initials affixed to the dedications and epistles "To the Reader."

In 1624 was published "The Historie of the Life and Death of Mary Stuart Queene of Scotland." The dedication is signed Wil Stranguage. In 1636 it was reprinted, the same dedication being signed W. Vdall. There are numerous similar instances.

Chapter XIV. THE CLUE TO THE MYSTERY OF BACON'S LIFE.

The theory now put forward is based upon the assumption that Francis Bacon at a very early age adopted the conception that he would devote his life to the construction of an adequate language and literature for his country and that he would do this remaining invisible. If he was the author of "The Anatomie of the Mind," 1576, and of "Beautiful Blossoms," 1577, he must have adopted this plan of obscurity as early as his sixteenth year. It is possible, however, that it may be shown that at a date still earlier he had decided upon this course. This, however, is beyond doubt — that if Francis Bacon was associated in any way with the literature of England from 1570 to 1605, with the exception of the small volume of essays published in 1597, he most carefully concealed his connection with it.

"Therefore, set it down," he says in the essay Of Simulation and Dissimulation, "that a habit of secrecy is both politic and moral," and in *Examples of the Antitheta*,[33] "Dissimulation is a compendious wisdome." Here again is the same idea: "Beside in all wise humane Government, they that sit at the helme, doe more happily bring their purposes about, and insinuate more easily things fit for the people by pretexts, and oblique courses; than by ... downright dealing. Nay (which perchance may seem very strange) in things meerely naturall, you may sooner deceive nature than force her; so improper and selfeimpeaching are open direct proceedings; whereas on the other side, an oblique and an insinuating way, gently glides along, and compasseth the intended effect."[34]

It is noteworthy that Bacon had a quaint conceit of the Divine Being which he was never tired of repeating. In the preface to the "Advancement of Learning" (1640), the following passage occurs: —

"*For of the knowledges which contemplate the works of Nature, the holy Philosopher hath said expressly*; that the glory of God is to conceal a thing, but the glory of the King is to find it out: *as if the Divine Nature, according to the*

innocent and sweet play of children, which hide themselves to the end they may be found; took delight to hide his works, to the end they might be found out; and of his indulgence and goodness to mankind, had chosen the Soule of man to be his Play-fellow in this game."

Again on page 45 of the work itself he says: —

"For so he (King Solomon) saith expressly, *The Glory of God is to conceale a thing, but the Glory of a King is to find it out*. As if according to that innocent and affectionate play of children, the Divine Majesty took delight to hide his works, to the end to have them found out, and as if *Kings* could not obtain a greater Honour, then to be God's play-fellowes in that game, especially considering the great command they have of wits and means, whereby the investigation of all things may be perfected."

Another phase of the same idea is to be found on page 136.

In the author's preface to the "Novum Organum" the following passage occurs: —

"Whereas of the sciences which regard nature the Holy Philosopher declares that 'it is the glory of God to conceal a thing, but it is the glory of the King to find it out.' Even as though the Divine Nature took pleasure in the innocent and kindly sport of children playing at hide and seek, and vouched-safe of his kindness and goodness to admit the human spirit for his play fellow in that game."

In almost identical words Bacon suggests the same conception in "In Valerius Terminus" and in "Filum Labyrinthi."

In the Epistle Dedicatorie of "The French Academie" and elsewhere the author is insisting on the same idea that "He (God) cannot be seene of any mortal creature but is notwithstanding known by his works."

The close connection of Francis Bacon with the works (now seldom studied) of the Emblem writers is vouched for by J. Baudoin.

Oliver Lector in "Letters from the Dead to the Dead" has given examples of his association with the Dutch and French emblem writers. Three Englishmen appear to have indulged in this fascinating pursuit — George Whitney (1589),

Henry Peacham (1612), and George Withers (1634). From the Baconian point of view Peacham's "Minerva Britannia" is by far the most interesting. The Emblem on page 34 is addressed "To the most judicious and learned, Sir Francis Bacon Knight." On the opposite leaf, paged thus, ·33,[37] the design represents a hand holding a spear as in the act of shaking it. But it is the frontispiece which bears specially on the present contention. The design is now reproduced (Fig. IV). A curtain is drawn to hide a figure, the hand only of which is protruding. It has just written the words "Mente Videbor"— "By the mind I shall be seen." Around the scroll are the words "Vivitur ingenio cetera mortis erunt" — one lives in one's genius, other things shall be (or pass away) in death.

That emblem represents the secret of Francis Bacon's life. At a very early age, probably before he was twelve, he had conceived the idea that he would imitate God, that he would hide his works in order that they might be found out — that he would be seen only by his mind and that his image should be concealed. There was no haphazard work about it. It was not simply that having written poems or plays, and desiring not to be known as the author on publishing them, he put someone else's name on the title-page. There was first the conception of the idea, and then the carefully-elaborated scheme for carrying it out.

There are numerous allusions in Elizabethan and early Jacobean literature to someone who was active in literary matters but preferred to remain unrecognised. Amongst these there are some which directly refer to Francis Bacon, others which occur in books or under circumstances which suggest association with him. It is not contended that they amount to direct testimony, but the cumulative force of this evidence must not be ignored. In some of the emblem books of the period these allusions are frequent.

Then there is John Owen's epigram appearing in his "Epigrammatum," published in 1612.

AD. D.B.

"Si bene qui latuit, bene vixit, tu bene vivis:

Ingeniumque tuum grande latendo patet."

"Thou livest well if one well hid well lives,
And thy great genius in being concealed is revealed."

D. is elsewhere used by Owen as the initial of Dominus. The suggestion that Ad. D.B. represents Ad Dominum Baconum is therefore reasonable.

Thomas Powell published in 1630 the "Attourney's Academy." The book is dedicated "To True Nobility and Tryde learning beholden To no Mountaine for Eminence, nor supportment for Height, Francis, Lord Verulam and Viscount St. Albanes." Then follow these lines: —

"O Give me leave to pull the Curtaine by
That clouds thy Worth in such obscurity.
Good Seneca, stay but a while thy bleeding,
T' accept what I received at thy Reading:
Here I present it in a solemne strayne,
And thus I pluckt the Curtayne backe again."

In the "Mirrour of State and Eloquence," published in 1656, the frontispiece is a very bad copy of Marshall's portrait of Bacon prefixed to the 1640 Gilbert Wat's "Advancement of Learning." Under it are these lines: —

"Grace, Honour, virtue, Learning, witt,
Are all within this Porture knitt
And left to time that it may tell,
What worth within this Peere did dwell."

The frontispiece previously referred to of "Truth brought to Light and discovered by Time, or a discourse and Historicall narration of the first XIIII. yeares of King James Reign," published in 1651, is full of cryptic meaning and in one section of it there is a representation of a coffin out of which is growing

"A spreading Tree

Full fraught with various Fruits most fresh and fair
To make succeeding Times most rich and rare."

The fruits are books and manuscripts. The volume contains speeches of Bacon and copies of official documents signed by him.

The books of the emblem writers are still more remarkable. "Jacobi Bornitii Emblemata Ethico Politica," 1659, contains at least a dozen plates in which Bacon is represented. A suggestive emblem is No. 1 of Cornelii Giselberti Plempii Amsterodarnum Monogrammon, bearing date 1616, the year of Shakespeare's death. It is now reproduced (Fig. V.). It will be observed that the initial letters of each word in the sentence — *Obscœnumque nimis crepuit Fortuna Batavis appellanda* — yield F. Bacon. There are in other designs figures which are evidently intended to represent Bacon. Emblem XXXVI. shows the inside of a printer's shop and two men at work in the foreground blacking and fixing the type. Behind is a workman setting type, and standing beside him, apparently directing, or at any rate observing him, is a man with the well-known Bacon hat on.

The contention may be stated thus: — Francis Bacon possessed, to quote Macaulay, "the most exquisitely constructed intellect that has ever been bestowed on any of the children of men." Hallam described him as "the wisest, greatest of mankind," and affirmed that he might be compared to Aristotle, Thucydides, Tacitus, Philippe de Comines, Machiavelli, Davila, Hume, "all of these together," and confirming this view Addison said that "he possessed at once all those extraordinary talents which were divided amongst the greatest authors of antiquity." At twelve years of age in industry he surpassed the capacity, and, in his mind, the range of his contemporaries, and had acquired a thorough command of the classical and modern languages. "He, after he had survaied all the Records of Antiquity, after the volumes of men, betook himself to the volume of the world and conquered whatever books possest." Having, whilst still a youth, taken all knowledge to be his province, he had read, marked, and absorbed the contents of nearly every book that had been printed. How that

boy read! Points of importance he underlined and noted in the margin. Every subject he mastered — mathematics, geometry, music, poetry, painting, astronomy, astrology, classical drama and poetry, philosophy, history, theology, architecture.

Then — or perhaps before — came this marvellous conception, "Like God I will be seen by my works, although my image shall never be visible — *Mente videbor*. By the mind I shall be seen." So equipped, and with such a scheme, he commenced and successfully carried through that colossal enterprise in which he sought the good of all men, though in a despised weed. "This," he said, "whether it be curiosity or vainglory, or (if one takes it favourably) philanthropia, is so fixed in my mind as it cannot be removed."

Translations of the classics, of histories, and other works were made. In those he no doubt had assistance by the commandment of more wits than his own, which is a thing he greatly affected. Books came from his pen — poetry and prose — at a rate which, when the truth is revealed, will literally "stagger humanity." Books were written by others under his direction. He saw them through the press, and he did more. He had his own wood blocks of devices, some, at any rate, of which were his own design, and every book produced under his direction, whether written by him or not, was marked by the use of one or more of these wood blocks. The favourite device was the light A and the dark A. Probably the first book published in England which was marked with this device was *De Rep. Anglorum Instauranda libri decem, Authore Thoma Chalonero Equite, Anglo*. This was printed by Thomas Vautrollerius,[36] and bears date 1579.

Vautrollier, and afterwards Richard Field, printed many of the books in the issue of which Bacon was concerned from 1579 onwards. Henry Bynneman, and afterwards his assignees Ralph Newbery and Henry Denham and George Bishop, who was associated with Denham, were also printing books issued under his auspices, and later Adam Islip, George Eld and James Haviland came in for a liberal share of his patronage.

The cost of printing and publishing must have been very great. If the facts ever come to light it will probably be found that Burghley was Bacon's mainstay

for financial support. It will also be found that Lady Anne Bacon and Anthony Bacon were liberal contributors to the funds, and that the cause of Francis Bacon's monetary difficulties and consequent debts was the heavy obligation which he personally undertook in connection with the production of the Elizabethan literature.

In the Dedications, Prefaces, and Epistles "To the Reader" also Francis Bacon's mind may be recognised. When Addison wrote of Bacon, "One does not know which to admire most in his writings, the strength of reason, force of style, or brightness of imagination," his words might have been inspired by these prefixes to the literature of this period. When once the student has made himself thoroughly acquainted with Bacon's style of writing prefaces he can never fail to recognise it, especially if he reads the passages aloud. The Epistle Dedicatorie to the 1625 edition of Barclay's "Argenis," signed Kingesmill Long, is one of the finest examples of Baconian English extant. Who but the writer of the Shakespeare plays could have written that specimen of musical language? To hear it read aloud gives all the enjoyment of listening to a fine composition of music. It is the same with the Shakespeare plays; only when they are read aloud can the richness and charm of the language they contain be appreciated.

Bacon's work can never be understood by anyone who has not realised the marvellous character of the mind of the boy, his phenomenal industry, and the fact that "he could imagine like a poet and execute like a clerk of the works." It has been suggested that he had a secret Society, by the agency of which he carried through his works, but it is difficult to find any evidence that such a Society existed. It may be that he had helpers without there having been anything of the nature of a Society.

From 1575 to 1605 (thirty years) with the exception of the trifles published as Essays in 1597, there are no acknowledged fruits of his work to which his name is attached. Even the two books of the "Advancement of Learning," published in 1605, would have made little demands on his time. Edmund Burke said: "Who is there that hearing the name of Bacon does not instantly recognise everything of genius the most profound, of literature the most extensive, of discovery the most

penetrating, of observation of human life the most distinguished and refined." For such a man to write "The two books" would be no hard or lengthy task.

The wonder is that Francis Bacon should have attached his name to the 1597 edition of the essays. He had written and published under other names tomes of essays of at least equal merit. In Aphorism 128 of the "Novum Organum" Bacon says, "But how sincere I am in my profession of affection and goodwill towards the received sciences my published writings, especially the books on the Advancement of Learning, sufficiently shew." What are the published writings referred to? The only works which bore his name were the incomplete volume of the Essays and the "Wisdom of the Ancients," to neither of which the words quoted are applicable.

Anthony Bacon, writing to Lady Anne in April, 1593, referring to her "motherly offer" to help Francis out of debt by being content to bestow the whole interest in an estate in Essex, called Markes, said "beseeching you to believe that being so near and dear unto me as he is, it cannot but be a grief unto me to see a mind that hath given so sufficient proof of itself in having brought forth many good thoughts for the general to be overburdened and cumbered with a care of clearing his particular estate."

In 1593 nothing had been published under Bacon's name, and there is not any production of his known which would justify Anthony's remark. What was his motive in selecting this insignificant little volume of essays whereby to proclaim himself a writer? One can understand his object in addressing James in *The Two Books of the Advancement of Learning*. He obtained in 1606, as Peacham has it, "preferment by his Patrone's letter" by being appointed Solicitor-General.

During all this period — 1575 to 1605— "the most exquisitely constructed mind that has ever been bestowed on any of the children of men" appears to have been dormant. Take the first three volumes of Spedding's "Life and Letters," and carefully note all that is recorded as the product of that mind during the years when it must have been at the zenith of its power and activity. All the letters and tracts accredited to Bacon in them which have come down to us would not account for six months — not for three months — of its occupation.

The explanation that he was building up his great system of inductive philosophy is quite inadequate. Rawley speaks of the "Novum Organum" as having been in hand for twelve years. This would give 1608 as the year when it was commenced. The "Cogitata et Visa," of which it was an amplification, was probably written in 1606 or 1607, for on the 17th February, 1607-8, Bodley writes acknowledging the receipt of it and commenting on it.

Rawley says that it was during the last five years of Bacon's life that he composed the greatest part of his books and writings both in English and Latin, and supplies a list which comprises all his acknowledged published works except the "Novum Organum" and the Essays.

In "The Statesmen and Favourites of England since the Reformation," it is stated that the universal knowledge and comprehension of things rendered Francis Bacon the observation of great and wise men, and afterward the wonder of all. Yet it is remarkable how few are the references to him amongst his contemporaries. Practically the only one that would enable a reader to gain any knowledge of his personality is Francis Osborn, who, in letters to his son, published in 1658, describes him as he was in the last few years of his life. No one has left data which enables a clear impression to be formed of Francis Bacon as he was up to his fortieth year. The omission may be described as a conspiracy of silence. How exactly the circumstances appear to fit in with the first line of John Owen's epigram to Dominus B., published in 1612!— "Thou livest well if one well hid well lives"; and if the suggestion now put forward be correct that Bacon deliberately resolved that his image and personality should never be seen, but only the fruits of his mind — the issues of his brain, to use Rawley's expression — how apt is the second line of the epigram: "And thy great genius in being concealed, is revealed."

Chapter XV. BURGHLEY AND BACON.

There was published in 1732 “The Life of the Great Statesman William Cecil, Lord Burghley.” The preface signed by Arthur Collins states: —

The work I have for several years engaged in, of treating of those families that have been Barons of this Kingdom, necessarily induced me to apply to our Nobility for such helps, as might illustrate the memory of their ancestors. And several Noblemen having favour’d me with the perusal of their family evidences, and being recommended to the Right Honourable the present Earl of Exeter, his Lordship out of just regard to the memory of his great Ancestor, was pleased to order the manuscript Life of the Lord Burghley to be communicated to me.

Which being very old and decayed and only legible to such who are versed in ancient writings it was with great satisfaction that I copied it literatim. And that it may not be lost to the world, I now offer it to the view of the publick. It fully appears to be wrote in the reign of Queen Elizabeth soon after his Lordship’s death, by one who was intimate with him, and an eye witness of his actions for the last twenty-five years. It needs no comment to set it off; that truth and sincerity which shines through the whole, will, I don’t doubt have the same weight with the Readers as it had with me and that they will be of opinion it’s too valuable to be buried in oblivion.

This “Life of Lord Burghley” is referred to by Nares and other of his biographers as having been written by “a domestic.” It contains about 16,000 words and is the most authentic account extant of the great statesman’s life. The narrative is full, but the observations on the character and habits of Burghley are by far the most important feature. The method of treatment of the subject is after Bacon’s style; the Life abounds with phrases and with tricks of diction, which enable it to be identified as his. The concluding sentences could only have been written with Bacon’s pen: —

And so leaving his soule with God, his fame to the world, and the truth to all charitable mynds, I leave the sensure to all judicious Christians, who truly

practising what they professe, will better approve, and more indifferentlie interpret it, than envie or malice can disprove it. The best sort will ever doe right, the worst can but imagine mischief and doe wrong; yet this is a comfort, the more his virtues are troden downe, the more will theire brightnes appeare. Virtus vulnerata virescit.

In 1592 the “Responsio ad edictum Reginæ Angliæ” of the Jesuit Parsons had appeared, attacking the Queen and her advisers (especially Burghley), to whom were attributed all the evils of England and the disturbances of Christendom. The reply to this was entrusted to Francis Bacon, who responded with a pamphlet entitled “Certain observations upon a libel published this present year, 1592.” It was first printed by Dr. Rawley in the “Resuscitatio” in 1657. At the time it was written it was circulated largely in manuscript, for at least eight copies, somewhat varying from each other, have been preserved.[35] It is quite possible that it was printed at the time, but that no copy has survived. Throughout the whole work there are continual references to Burghley. Chapter VI. is entirely devoted to his defence and is headed “Certain true general notes upon the actions of the Lord Burghley.” Either “The Life” and the “Observations on a Libel” are by the same writer or the author of the former borrowed the latter very freely.

It is to be regretted that the original manuscript of the “Life” cannot now be found. In 1732 it was at Burghley House. Application has been made to the present Marquis of Exeter for permission to inspect it, but his Lordship’s librarian has no knowledge of its existence. If it could be examined it is probable that if the text was not in Bacon’s handwriting some notes or alterations might be recognised as his. The writer says he was an eye witness of Burghley’s life and actions twenty-five years together — that would be from 1573 to 1598, which would well accord with the present contention. If Bacon was the author it throws considerable light on his relations with Burghley and establishes the fact that they were of the most cordial and affectionate character. It is reported that Bacon said that in the time of the Burghleys — father and son — clever or able

men were repressed, and mainly upon this has been based the impression that Burghley opposed Francis Bacon's progress.

Burghley's biographer refers to this report. He writes: "He was careful and desirous to furder and advaunce men of quality and desart to be Councellors and officers to her Majesty wherein he placed manie and laboured to bring in more ... yet would envy with her slaunders report he hindered men from rising; but howe true it is wise men maie judge, for it was the Queene to take whom she pleased and not in a subject to preferree whom he listed."

It will eventually be proved that such a report conveys an incorrect view. In the letter of 1591,[36] addressed to Burghley, Bacon says:— "Besides I do not find in myself so much self-love, but that the greater parts of my thoughts are to deserve well (if I were able) of my friends and namely of your Lordship; who being the Atlas of this Commonwealth, the honour of my house, and the second founder of my poor estate, I am tied by all duties, both of a good patriot, and of an unworthy kinsman, and of an obliged servant, to employ whatsoever I am to do your service," and later in the letter he employs the phrase, "And if your Lordship will not carry me on," and then threatens to sell the inheritance that he has, purchase some quick revenue that may be executed by another, and become some sorry bookmaker or a pioneer in that mine of truth which Anaxagoras said lay so deep.

Again, in a letter to Burghley, dated 31st March, 1594, he says:— "Lastly, that howsoever this matter may go, yet I may enjoy your lordship's good favour and help as I have done in regard to my private estate, which as I have not altogether neglected so I have but negligently attended and which hath been bettered only by yourself (the Queen except) and not by any other in matter of importance." Further on he says: "Thus again desiring the continuance of your Lordship's goodness as I have hitherto found it on my part sought also to deserve, I commend," *etc.*

It is very easy, with little information as to Bacon's actions and little knowledge of the period, to form a definite opinion as to the relations of Bacon and Burghley. The more information as to the one and knowledge of the other

one gets, the more difficult does it become to arrive at a satisfactory conclusion. Here was the son of Elizabeth's great Lord Keeper, the nephew of her trusted minister, himself from his boyhood a *persona grata* with the Queen, of brilliant parts and great wisdom — if he had been a mere place-hunter his desires could have been satisfied over and over again. There was some condition of circumstance, of which nothing has hitherto been known, which prevented him from obtaining the object of his desires. That he had a definite object, and had mapped out a course by which he hoped to achieve it, is evident from his letters[37] already quoted. It is equally clear that the course he sought to pursue entailed his abandoning the law as a profession. Either he would only have such place as he desired, and on his own terms, or he was known to be following some course which, although not distasteful to his close friends, caused him to be held in suspicion, if not distrust, by the courtiers with whom Elizabeth was surrounded. Every additional fact that comes to light seems to point to the truth being that through his life Burghley was Francis Bacon's staunch friend and supporter. Upon Sir Nicholas Bacon's death Burghley appears with Bodley to have been maintaining Bacon in his travels abroad. Upon his return to England Burghley gave him financial support in his great project. In 1591 there was a crisis — someone had been spending money for the past twelve years freely in making English literature. That cannot be gainsaid. Burghley appears to have pulled up and remonstrated; hence Bacon's letter containing the threat before referred to. It is significant that it was immediately after this letter was written that Bacon's association with Essex commenced. Bacon would take him and Southampton into his confidence and seek their help. Essex was just the man to respond with enthusiasm. Francis introduced Anthony to him. The services of the brothers were placed at his disposal, and he undertook to manage the Queen. The office of Attorney-General for Francis would meet the case. "It was dangerous in a factious age to have my Lord Essex his favour," says the biographer before quoted.[38]

That Burghley was favourable to his appointment as Attorney-General two letters written by Francis to Lord Keeper Puckering in 1594 testify. In the first

Bacon writes: “I pray your Lordship to call to remembrance my Lord Treasurer’s kind course, who affirmed directly all the rest to be unfit. And because *vis unita fortior* I beg your Lordship to take a time with the Queen when my Lord Treasurer is present.”

In a second letter he writes: “I thought good to remember your good Lordship and to request you as I touched in my last that if my Lord Treasurer be absent your Lordship would forbear to fall into my business with her Majesty lest it mought receive some foil before the time when it should be resolutely dealt in.”

Only Burghley was found to support Essex’s advocacy, and on the whole this was not to be wondered at. Such an appointment, to say the least, would have been an experiment. Possibly Essex was the stumbling-block, but it may be that the real objection on the part of the Queen and her advisers was that Bacon was known to be so amorous of certain learned arts, so much given over to invention, that the consensus of opinion was that he was thereby unfitted to hold an important office of the State. Or it may be that he was discredited by his suspected or known association with certain printers. There was some reason of which no explanation can now be traced.

It has been suggested that in 1591 there was a crisis in Bacon’s life. That is evident from the letter to Burghley written in that year. John Harrington’s translation of “Orlando Furioso” was published about this time. The manuscript, which is in a perfect condition, is in the British Museum, and has been marked in Bacon’s handwriting throughout. The pagination and the printer’s signature are placed at the commencement of the stanzas to be printed on each page, and there are instructions to the printer at the end which are not in his hand.

There are good grounds for attributing the notes at the end of each chapter to Bacon.

It is very improbable that Sir John Harrington had the classical knowledge which the writer of these notes must have possessed. There is a letter written by him to Sir Amias Pawlett, dated January, 1606-7. He is relating an interview with King James, and says: “Then he (the king) enquyrede muche of lernynge and showede me his owne in such sorte as made me remember my examiner at

Cambridge aforetyme. He soughte muche to knowe my advances in philosophie and utterede profounde sentences of Aristotle and such lyke wryters, whiche I had never reade and which some are bolde enoughe to saye others do not understand." It would be difficult to mention any classical author with whose works the writer of these notes was not familiar, or to believe that "Epigrams both Pleasant and Serious" (1615) came from the pen of that writer.

At the end of the thirty-seventh chapter the following note occurs: "It was because she (Porcia) wrote some verses in manner of an Epitaph upon her husband after his decease: In which kind, that honourable Ladie (widow of the late Lord John Russell) deserveth no lesse commendation, having done as much for two husbands. And whereas my author maketh so great bost only of one learned woman in Italie, I may compare (besides one above all comparison that I have noted in the twentith booke) three or foure in England out of one family, and namely the sisters of that learned Ladie, as witness that verse written by the meanest of the foure to the Ladie Burlie which I doubt if Cambridge or Oxford can mend."

The four daughters of Sir Anthonie Cooke

—

Ladie Burlie,
Ladie Russell,
Lady Bacon,
Mistress Killygrew.

Si mihi quem cupio
cures Mildreda remitti
Tu bona, tu melior, tu
mihi sola soror;
Sin mali cessando
retines, & trans mare
mittis,
Tu mala, tu peior, tu
mihi nulla soror.
Is si Cornubiam, tibi

She wrote to Lady Burlie to send a kinsman of hers into Cornwall, where she dwelt, and to

pax sit & omnia læta,	stop his
Sin mare Ceciliæ	going
nuncio bella. Vale.[39]	beyond sea.

The writer of the Latin verse was *not* Ladie Russell, and it was written *to* Ladie Burlie, so she must either be Ladie Bacon or Mistress Killigrew. It is not an improbable theory that Ladie Bacon was writing to her sister Mildred, who had, through her husband, power either to send Francis to Cornwall or permit him to be sent away over the seas.

There is a copy of Machiavelli's "History of Florence," 1595, with Bacon's notes in the margins.[40]

At the end is a memorandum giving the dates when the book was read "in Cornwall at," and then follow two words, the second of which is "Lake," but the first is undecipherable.

Is it possible that Lady Anne Bacon had a house in Cornwall which Francis Bacon, inheriting after her death, was in the habit of visiting for retirement? But this is conjecture.

The following point is of interest. In the "Life of Burghley" (1598) it is said that: "Bookes weare so pleasing to him, as when he gott libertie to goe unto his house to take ayre, if he found a book worth the openinge, he wold rather loose his ridinge than his readinge; and yet ryding in his garden walks upon his litle moile was his greatest Disport: But so soone as he came in he fell to his readinge againe or els to dispatchinge busines."

Rawley, in his "Life of Bacon" (1657), attributes an exactly similar habit to the philosopher, and almost in identical phrase: "For he would ever interlace a moderate relaxation of his mind with his studies as walking, or taking the air abroad in his coach or some other befitting recreation; and yet he would lose no time, inasmuch as upon his first and immediate return he would fall to reading

again, and so suffer no moment of time to slip from him without some present improvement."

It is difficult to approach any phase of the life of Bacon without being confronted with what appears to be evidence of careful preparation to obscure the facts. This observation does not result from imagination or prejudice; Bacon's movements are always enshrouded in mystery. Investigation and research will, however, eventually establish as a fact that there was a closer connection between Burghley and Bacon than historians have recognised, and that they had a strong attachment for each other.

Chapter XVI. THE 1623 FOLIO EDITION OF SHAKESPEARE'S PLAYS.

Sir Sydney Lee has written[41]:— "As a specimen of typography, the First Folio is not to be commended. There are a great many contemporary folios of larger bulk far more neatly and correctly printed. It looks as though Jaggard's printing office was undermanned. The misprints are numerous, and are especially conspicuous in the pagination." In the same year was published "The Theater of Honour and Knighthood," translated from the French of Andreu Favine. William Jaggard was the printer. It is a large folio volume containing about 1,200 pages, and is referred to as being issued by Jaggard as an example of the printer's art to maintain his reputation, which had suffered from the apparently careless manner in which the Shakespeare Folio was turned out. Both books contain the same emblematic head-pieces and tail-pieces. There are, however, some considerable mispaginations in "The Theater of Honour." Mispaginations were not infrequent in Elizabethan and Jacobean literature, but it is quite possible that they were not unintentional. The most glaring instance is to be found in the first Edition of "The Two Bookes of Francis Bacon — Of the Proficience and Advancement in Learning, Divine and Humane," published by Henrie Tomes (1605). Each leaf (not page) is numbered. The 45 leaves of the first book are correctly numbered. In the second book there is no number on leaf 6. Leaf 9 is numbered 6, the right figure being printed upside down; 30 is numbered 33; from 31 to 70 the numbering is correct, and then the leaves are numbered as follows: — 70, 70, 71, 70, 72, 74, 73, 74, 75, 69, 77, 78, 79, 80, 77, 74, 74, 69, 69, 82, 87, 79, 89, 91, 92, 93, 94, 95, 99, 97, 99, 94, 100, 99, 102, 103, 103, 93, 106, and on correctly until the last page, 118, except that 115 is numbered 105.

It is impossible to attribute this mispagination to the printer's carelessness. This was the first work published bearing Bacon's name, excepting the trifle of essays published in 1597. There does not appear to have been any hurry in its production. It is quite a small volume, and yet the foregoing remarkable

mispaginations occur. There must be some purpose in this which has yet to be found out.

The 1623 Shakespeare Folio will be found to be one of the most perfect examples of the printer's art extant, because no work has been produced under such difficult conditions for the printer. There are few mistakes in pagination or spelling which are not intentional. The work is a masterpiece of enigma and cryptic design. The lines "To the Reader" opposite to the title-page are a table or code of numbers. The same lines and the lettering on the title-page form another table. The ingenuity displayed in this manipulation of words and numbers to create analogies is almost beyond the comprehension of the human mind. The mispaginations are all intentional and have cryptic meanings. The acme of wit is the substitution of 993 for 399 on the last page of the tragedies; a hundred has been omitted in "Hamlet," 257 following 156, and other errors made in order to obtain this result on the last page. The manner in which the printer's signatures have been arranged with the pages is equally wonderful. The name William Shakespeare must have been created without reference to him of Stratford, who possibly bore or had assigned to him a somewhat similar name. A great superstructure is built up on the exact spelling of the words William Shakespeare. The year 1623 was specially selected for the issue of the complete volume of the plays, because of the marvellous relations which the numbers composing it bear to the names William Shakespeare and Francis Bacon, to the year 1560, in which the birth of Bacon is registered, and to 1564 and 1616, the reputed dates of the birth and death of the Stratford man. Nor do the wonders end here. The use of numerical analogies has been carried into the construction of the English language. All this, and much more, will be made manifest when the work of Mr. E. V. Tanner comes to be investigated and appreciated. He has made the greatest literary discovery of all time. The wonder is how it has been possible for anyone to pierce the veil and reveal the secrets of the volume. The value of the Shakespeare Folio 1623 will be enhanced. It will stand alone as the greatest monument of the achievements of the human intellect.

To any literary critic who should honour this book by noticing it, it is probable the foregoing statements may seem extravagant and untrustworthy. To such the request is now made that before making any comment he will inspect the proof of the foregoing statements which are in the writer's possession. The dramas of Shakespeare are, by universal consent, placed at the head of all literature. The invitation is now put forth in explicit terms, and facilities are offered for the investigation of the truth, or otherwise, of every statement made in the foregoing paragraph.

Chapter XVII. THE AUTHORIZED VERSION OF THE BIBLE, 1611.

Is it not strange that there is no mention of any connection of Francis Bacon with this work? There was a conference held at Hampton Court Palace before King James on January, 1603, between the Episcopalians and Puritans. John Rainoldes urged the necessity of providing for his people a uniform translation of the Bible. Rainoldes was the leader of the Puritans, a person of prodigious reading and doctrine, and the very treasury of erudition. Dr. Hall, Bishop of Norwich, reports that "he alone was a well furnished library, full of all faculties, of all studies, of all learning — the memory and reading of that man were near a miracle." The King approved the suggestion and commissioned for that purpose fifty-four of the most learned men in the universities and other places. There was a "careful selection of revisers made by some unknown but very competent authority." The translators were divided into six bands of nine each, and the work of translation was apportioned out to them. A set of rules was drawn up for their guidance, which has happily come down to modern times — almost the only record that remains of this great undertaking. These concise rules have a homogeneity, breadth and vigour which point to Bacon as their author. Each reviser was to translate the whole of the original allocated to his company; then they were to compare their translations together, and, as soon as a company had completed its part, it was to communicate the result to the other companies, that nothing might pass without the general consent. If any company, upon the review of the translation so sent, differed on any point, they were to note their objection and state their reasons for disagreement. If the differences could not be adjusted, there was a committee of arbitration which met weekly, consisting of a representative from each company, to whom the matter in dispute was referred. If any point was found to be very obscure, letters were to be addressed, by authority, to learned persons throughout the land inviting their judgment. The work was commenced in 1604. Rainoldes belonged to the company to whom

Isaiah and the prophets were assigned. He died in 1607, before the work was completed. During his illness his colleagues met in his bedroom so that they might retain the benefit of his learning. Only forty-seven out of the fifty-four names are known. When the companies had completed their work, one complete copy was made at Oxford, one at Cambridge, and one at Westminster. Those were sent to London. Then two members were selected from each company to form a committee to review and polish the whole. The members met daily at Stationers' Hall and occupied nine months in their task. Then a final revision was entrusted to Dr. Thomas Bilson and Dr. Miles Smith, and in 1609 their labours were completed and the result was handed to the King. Many of the translators have left specimens of their writing in theological treatises, sermons, and other works. A careful perusal of all these available justifies the assertion that amongst the whole body there was not one man who was so great a literary stylist as to be able to write certain portions of the Authorised Version, which stamp it as one of the two greatest examples of the English language. Naturally the interest centres on Dr. Thomas Bilson and Dr. Miles Smith, to whom the final revision was entrusted. There are some nine or ten theological works by the former and two sermons by the latter. Unless the theory of a special divine inspiration for the occasion be admitted, it is clear that neither Bilson nor Miles Smith could have given the final touches to the Bible. And now a curious statement has come down to us. In 1609 the translators handed their work to the King, and in 1610 he returned it to them completed. James was incapable of writing anything to which the term beautiful could be applied. What had happened to the translators' work whilst it was left in his hands?

James had an officer of state at that time of whom a contemporary biographer wrote that "he had the contrivance of all King James his Designs, until the match with Spain." It will eventually be proved that the whole scheme of the Authorised Version of the Bible was Francis Bacon's. He was an ardent student not only of the Bible, but of the early manuscripts. St. Augustine, St. Jerome, and writers of theological works, were studied by him with industry. He has left his annotations in many copies of the Bible and in scores of theological works.

The translation must have been a work in which he took the deepest interest and which he would follow from stage to stage. When the last stage came there was only one writer of the period who was capable of turning the phrases with that matchless style which is the great charm of the Shakespeare plays. Whoever that stylist was, it was to him that James handed over the manuscripts which he received from the translators. That man then made havoc of much of the translation, but he produced a result which, on its literary merits, is without an equal.

Thirty years ago another revision took place, but, notwithstanding the advantages which the revisers of 1880 had over their predecessors of 1611, their version has failed to displace the older version, which is too precious to the hearts of the people for them to abandon it.

Although not one of the translators has left any literary work which would justify the belief that he was capable of writing the more beautiful portions of the Bible, fortunately Bacon has left an example which would rather add lustre to than decrease the high standard of the Bible if it were incorporated in it. As to the truth of this statement the reader must judge from the following prayer, which was written after his fall, and which was described by Addison as resembling the devotion of an angel rather than a man: —

Remember, O Lord, how Thy servant hath walked before Thee; remember what I have first sought, and what been principal in mine intentions. I have loved Thy assemblies; I have mourned for the divisions of Thy Church; I have delighted in the brightness of Thy sanctuary.

This vine, which Thy right hand hath planted in this nation, I have ever prayed unto Thee that it might have the first and the latter rain, and that it might stretch her branches to the seas and to the floods.

The state and bread of the poor and oppressed have been precious in mine eyes. I have hated all cruelty and hardness of heart. I have, though in a despised weed, procured the good of all men.

If any have been mine enemies, I thought not of them, neither hath the sun almost set upon my displeasure; but I have been as a dove, free from superfluity

of maliciousness.

Thy creatures have been my books, but Thy scriptures much more. I have sought Thee in the courts, fields, and gardens, but I have found Thee in Thy temples.

Thousand have been my sins and ten thousand my transgressions, but Thy sanctifications have remained with me, and my heart, through Thy grace, hath been an unquenched coal upon Thine altar.

O Lord, my strength, I have since my youth met with Thee in all my ways, by Thy fatherly compassions, by Thy comfortable chastisements, and by Thy most visible providence. As Thy favours have increased upon me, so have Thy corrections, so that Thou hast been ever near me, O Lord; and ever, as Thy worldly blessings were exalted, so secret darts from Thee have pierced me, and when I have ascended before men, I have descended in humiliation before Thee.

And now, when I thought most of peace and honour, Thy hand is heavy upon me, and hath humbled me according to Thy former lovingkindness, keeping me still in Thy fatherly school, not as a bastard but as a child. Just are Thy judgments upon me for my sins, which are more in number than the sands of the sea, but have no proportion to Thy mercies; for what are the sands of the sea to the sea? Earth, heavens, and all these are nothing to Thy mercies.

Besides my innumerable sins, I confess before Thee that I am debtor to Thee for the gracious talent of Thy gifts and graces, which I have neither put into a napkin, nor put it (as I ought) to exchangers, where it might have made most profit, but misspent it in things for which I was least fit so that I may truly say my soul hath been a stranger in the course of my pilgrimage.

Be merciful unto me, O Lord, for my Saviour's sake, and receive me into Thy bosom or guide me in Thy ways.

There is another feature about the first editions of the Authorised Version which arrests attention. In 1611 the first folio edition was published. The design with archers, dogs and rabbits which is to be found over the address "To the Christian Reader" which introduces the genealogies is also to be found in the folio edition of Shakespeare over the dedication to the most noble and

Incomparable paire of Brethren, over the Catalogue and elsewhere. Except that the mark of query which is on the head of the right hand pillar in the design in the Bible is missing in the Shakespeare folio, and the arrow which the archer on the right hand side is shooting contains a message in the design used in the Bible and is without one in the Shakespeare folio.

In the 1612 quarto edition of the Authorised Version on the title-page of the Genealogies are two designs; that at the head of the page is printed from the identical block which was used on the title-page of the first edition of "Venus and Adonis," 1593, and the first edition of "Lucrece," 1594. At the bottom is the design with the light A and dark A, which is over the dedication to Sir William Cecil in the "Arte of English Poesie," 1589. An octavo edition, which is now very rare, was also published in 1612. On the title-page of the Genealogies will be found the design with the light A and dark A which is used on several of the Shakespeare quartos and elsewhere. (Figure XXI.)

The selection of these designs was not made by chance. They were deliberately chosen to create similitudes between certain books, and mark their connection with each other.

The revised translation of the Bible was undertaken as a national work. It was carried out under the personal supervision of the King, but every record of the proceedings has disappeared. The British Museum does not contain a manuscript connected with the proceedings of the translators. In the Record Office have been preserved the original documents referring to important proceedings of that period. The parliamentary, judicial, and municipal records are, on the whole, in a complete condition, but ask for any records connected with the Authorised Version of the Bible and the reply is: "We have none." And yet it is reasonable to suppose that manuscripts and documents of such importance would be preserved. Where are they to be found?

Chapter XVIII. HOW BACON MARKED BOOKS WITH THE PUBLICATION OF WHICH HE WAS CONNECTED.

At a very early period in the history of printing, the custom was introduced of placing on title-pages, at the heads and ends of the chapters, emblematical designs. In English printed books these are seldom to be found until the latter half of the 16th century.

An investigation of the books of the period reveals the fact that the same blocks were used by different printers. Articles have been written on the migration of printer's blocks, but, so far, no explanation has been offered as to any object other than decoration for which these blocks were used.

Among other designs in use between 1576 and 1640 are a number of variants of a device in which a light A and a dark A form the most conspicuous points. Camden, in his "Remaines Concerning Britaine," 1614, commences a chapter on "Impresses," at the head of which the device is found, thus:— "An Imprese (as the Italians call it) is a device in picture with his Motto, or Word, borne by noble and learned personages, to notifie some particular conceit of their owne: as Emblemes (that we may omitte other differences) doe propound some general instructions to all." Then follow a number of examples, and amongst them this:—

"Variete and vicissitude of humane things he seemed to shew which parted his shield, Per Pale, Argent & Sables and counter-changeably writte in the Argent, Ater and in the Sables Albus."

But even if the light A and dark A are used in the design of the head-piece to represent Albus and Ater it does not afford any satisfactory explanation as to why they are so used.

In MDCXVI. was published “Les Emblemes Moraulx et Militaires du Sieur Jacob De Bruck Angermundt Nouvellement mis en Lumiere A Strasbourg, Par Jacob de Heyden Graveur.”

In Emblem No. 18, now reproduced, the light A and the dark A will be found in the branch of the tree which the man is about to cut off. (Figure VI.)[42]

Another Emblem does not contain the light A and dark A, but the bark of the trunk and branches of the tree on the design exhibit a strong contrast between the dark and light, which feature is represented in most of the title-pages of books in which the device is found. (Figure VII.)

Mr. Charles T. Jacob, Chiswick Press, London, who is the author of “Books and Printing” (London, 1902), and several works on typography, referring to an article on the migration of woodblocks, said: —

It is a well-known fact to Bibliographers that the same blocks were sometimes used by different printers in two places quite far apart, and at various intervals during the seventeenth and eighteenth centuries. That the same blocks were employed is apparent from a comparison of technical defects of impressions taken at different places, and at two periods. There was no method of duplication in existence until stereotyping was first invented in 1725; even then the details were somewhat crude, and the process being new, it met with much opposition and was practically not adopted until the early part of the nineteenth century. Electrotyping, which is the ideal method of reproducing woodblocks, was not introduced until 1836 or thereabouts. Of course, it was quite possible to re-engrave the same design, but absolute fidelity could not be relied on by these means, even if executed by the same hand.

The earliest date which appears on a book in which the head-piece, containing the device of the light A and dark A is found, is 1563. The book is “De Furtivis Literarum Notis Vulgo. De Ziferis,” Ioan. Baptista Porta Neapolitano Authore. Cum Privilegio Neapoli, apud Ioa. Mariam Scotum. MDLXIII. (Figure VIII.)

It is only used once — over the dedication Ioanni Soto Philippi Regis. There is no other head-piece in the book. John Baptist Porta was, with the exception of

Trithemius, whom he quotes, the first writer on cyphers. At the time at which he wrote cypher-writing was studied in every Court in Europe. It is significant that this emblematic device is used in the earliest period in which head-pieces were adopted, in a book which is descriptive and is in fact a text-book of the art of concealment. This has, however, now been proved to be a falsely dated book.

The first edition of this work was published in Naples in 1563 by Ioa. Marius Scotus, but this does not contain the A A design. In 1591 the book was published in London by John Wolfe; this reprint was dedicated to Henry Percy, Earl of Northumberland. After the edition had been printed off, the title-page was altered to correspond with the 1563 Naples publication. The dedication was taken out, and a reprint of the original dedication was substituted, and over this was placed the A A head-piece; then an edition was struck off, and, until to-day, it has been sold and re-sold as the first edition of Baptista Porta's work. It is difficult to offer any explanation as to why this fraud was committed.

The first occasion upon which this device was used appears to be in a book so rare that no copy of it can be found, either in the British Museum or the Bodleian Library. Unfortunately, in the copy belonging to the writer, the title-page and the two first pages are missing. The work is called "Hebraicum Alphabethum Jo. Bovlaese." It is a Hebrew Grammar, with proof-sheets added. It is interleaved with sheets of English-made paper, containing Bacon's handwriting. Bound up with it is another Hebrew Grammar, similarly interleaved, called "Sive compendium, quintacunque Ratione fieri potuit amplessimum, Totius linguæ," published in Paris in 1566. The book ends with the sentence: "Ex collegio Montis — Acuti 20 Decembris 1576"; then follow two pages in Hebrew, with the Latin translation over it, headed "Decem Præcepta decalogi Exod." Over this is the design containing the light A and the dark A, and the squirrel and rabbits. (Figure IX.) One thing is certain, that the copy now referred to was in the possession of Bacon, and that the interleaved sheets of paper contain his handwriting, in which have been added page by page the equivalents of the Hebrew in Greek, Chaldæic, Syriac and Arabic.

In 1577 Christophor Plantin published an edition of Andrea Alciat's "Emblemata." On page 104 is Emblem No. 45, "In dies meliora." This has been re-designed for the 1577 edition. It contains at the back the pillars of Hercules, with a scroll around bearing the motto: "Plus oltre." These pillars stand on some arches, immediately in front of which is a mound or pyramid, two sides of which are seen. On one is to be found the light A and on the other the dark A. The design was appropriated by Whitney, and appears on page 53 in the 1586 edition of his Emblems. From this time forth, A A devices are to be found in numbers of books published in England, and on some published on the Continent. Amongst the former are the first editions of "Venus and Adonis," "Lucrece," the "Sonnets," the quarto editions of Shakespeare's plays, the folio edition (1623) of his works, and the first quarto and octavo editions (1612) of the Authorised Version of the Bible.

There are fourteen distinct designs, in all of which, varying widely in other respects, the light A and the dark A constitute the outstanding figure. The use of the two letters so shaded must have had a special significance. In nearly every case it will be observed that the letter A is so drawn as to make the letter C on the inside. Was its significance of general knowledge amongst printers and readers, or was it an earmarking device used by one person, or by a Society?

A possible interpretation of the use of the light and dark shading, is that the book in which it is used contains more than is revealed; that is to say, the overt and the concealed.

A copy of "Æsopiphrygis vita et fabellæ cum latina interpretatione" exists, date 1517. The book is annotated by Bacon. On one side is the Greek text and on the opposite page the Latin translation. On pages 102 and 103 are two initial letters printed from blocks of the letter A. These are coloured so that the one on the left hand side is a light A, and that on the opposite page a dark A.

There are other designs which are used apparently as part of a scheme. The identical block (Figure X.) which was used at the top of the title page of "Venus and Adonis" (1593) and "Lucrece" (1594) did service on the title page of the Genealogies in the quarto edition of the Authorised Version of the Bible, 1612.

This design was, so far as can be traced, only used twice in the intervening nineteen years — on "An Apologie of the Earl of Essex to Master Anthony Bacon," penned by himself in 1598, and printed by Richard Bradocke in 1603, and in 1607, on the "World of Wonders," printed by Richard Field. It was of this book that Caldecott, the bibliophile and Shakespearean scholar, wrote: "The phraseology of Shakespeare is better illustrated in this work than in any other book existing." The design which is found on the title page of the "Sonnets of Shakespeare," 1609, is found also in the first edition of Napier's "Mirifici Logarithmorum," 1611, but printed from a different block. The design with archers shooting at the base of the central figure is to be found in a large number of the folio editions of the period. Amongst these are the Authorised Version of the Bible, 1611, the "Novum Organum," 1620, and the 1623 edition of Shakespeare's works.

There are other designs which are usually found accompanying the light A and dark A and the other devices before referred to.

These designs were first brought into use from 1576 and practically cease to appear about 1626. Afterwards they are seldom seen except in books bearing Bacon's name, and eventually they lapse. The last use of an A A device is over the life of the author in the second volume of an edition of Bacon's Essays edited by Dr. William Willymott, published by Henry Parson in 1720. After an interval of about 60 years a new design is made, which is not one of those employed by Bacon.

By means of these devices a certain number of books may be identified as forming a class by themselves.

There is another feature connected with them which is of special interest. One man appears to have contributed to all the books thus marked — either the dedication, the preface,[43] or the lines "To the Reader"; in some cases all three. It may be urged in opposition to this view that in those days there was a form in which dedications and prefaces were written, and that this was more or less followed by many writers, but this contention will not stand investigation. There are tricks of phrasing and other peculiarities which enable certain literary

productions to be identified as the work of one man. Some of the finest Elizabethan literature is to be found in the prefaces and dedications in these books.

The theory now put forth is that Francis Bacon was directing the production of a great quantity of the Elizabethan literature, and in every book in the production of which he was interested, he caused to be inserted one of these devices. He kept the blocks in his own custody; he sent them out to a printer when a book was approved by him for printing. On the completion of the work, the printer returned the blocks to Bacon so that they could be sent elsewhere by him as occasion required.

The most elaborate of the AA designs is Figure XII., and the writer has only found it in one volume. It is "Le Historie della Citta Di Fiorenza," by M. Jacopo, published in Lyons by Theobald Ancelin in 1582.

"Exact was his correspondence abroad and at home, constant his Letters, frequent his Visits, great his obligations," states the contemporary biographer, speaking of Francis Bacon. It is difficult to arrive at the exact meaning of these words. There is little correspondence with those abroad remaining, no record of visits, no particulars of the great obligations into which he entered. In the dedication of the 1631 edition of the "Histoire Naturelle" to Monseigneur de Chasteauneuf, the author speaking of Bacon writes:— "Le Chancelier, qu'on a fait venir tant de fois en France, n'a point encore quitté l'Angleterre avec tant de passion de nous découvrir ses merveilles que depuis qu'il a sceu le rang dont on avoit reconnu vos vertus."

These frequent visits to France are unrecorded elsewhere, but here is definite testimony that they were made.

There are good grounds for believing that Bacon was throughout his life, until their deaths, in constant communication with Christophor Plantin (1514-1589), Aldus Manutius, Henry Stephen (1528-1598), and also with Robert Stephens the third (1563-1640). All these men were not only printers, but brilliant scholars and writers. If search be made, it is quite possible that correspondence or other evidence of their friendship may come to light. Be that as it may, there were

undoubtedly a number of books published on the continent between 1576 and 1630 which in the sparta upon them bear testimony to Bacon's association with their publication.

The following are instances of where the several designs which are reproduced may be found. They however occur in many other volumes.

Figure IX. — "The Arte of English Poesie," 1589.

" XIII. — "Orlando Furioso," 1607.

" XIV. — Spencer's "Fairie Queen."

" XV. — "Florentine History translation," 1595, and 1636 edition of Barclay's "Argenis."

" XI. — "Sonnets."

" XVI. — Simon Pateriche's translation of "Discourse against Machiavel."

" XVII. — Lodge's translation of "Seneca," 1614.

" XVIII. — Shakespeare Folio, 1623.

" XIX. — "Dæmonologie," 1603.

" XX. Alciat's "Emblems," published in

— Paris, 1584.

Chapter XIX. BACON AND EMBLEMATA.

In “Shakespeare and the Emblem Writers” the Rev. Henry Green endeavours to show the similarities of thought and expression between the great poet and the authors of Emblemata, but the line of enquiry which he there opened does not appear to have been followed by subsequent writers. To-day the Emblemata literature is a *terra incognita* except to a very few students, and yet it is full of interest, romance, and mystery. Emblem literature may be said to have had its origin with Andrea Alciat, the celebrated Italian jurisconsult, who was famous for his great knowledge and power of mind. In 1522 he published at Milan an “Emblematum Libellus,” or Little Book of Emblems. Green says: “It established, if it did not introduce, a new style of emblem literature, the classical in the place of the simply grotesque and humorous, or of the heraldic and mythic.” The first edition now known to exist was published at Augsburg in 1531, a small octavo containing eighty-eight pages with ninety-seven emblems, and as many woodcuts. It was from time to time augmented, and passed through many editions. For some years the Emblemata appears to have been produced chiefly by Italians, with a few Frenchmen. Until the last half of the sixteenth century the output of books of this character was not large. Thenceforth for the next hundred years the creation of emblems became a popular form of literary exercise. The Italians continued to be prolific, but Dutch, French, and German scholars were but little behind them. There were a few Englishmen and Spaniards who also practised the art.

In 1905 was published a book called “Letters from the Dead to the Dead,” by Oliver Lector. In it attention is drawn to the remarkable features of some of the books on emblems printed during Bacon’s life, and to the evidence that he was in some manner connected with the publication of many of these volumes. The author claims this to be especially the case with the “Emblemata Moralia et Bellica,” 1615, of Jacob de Bruck, of Angermundt, and the “Emblemata Ethic Politica” of J. Bornitius.

The emblem pictures for the most part appear to be picture puzzles. In the "Critique upon the Mythology of the Ancients" Bacon says: —

"It may pass for a farther indication of a concealed and secret meaning, that some of these fables are so absurd and idle in their narration as to proclaim and shew an allegory afar off. A fable that carries probability with it may be supposed invented for pleasure, or in imitation of history; but, those that would never be conceived or related in this way, must surely have a different use."

If this line of reasoning be applied to the illustrations in the emblem books, it is clear that they conceal some hidden meaning, for they are apparently unintelligible, and the accompanying letterpress does not afford any illumination.

Jean Baudoin was the translator of Bacon's "Essaies" into the French language (1626). Baudoin published in 1638-9 "Recueil D'Emblèmes divers avec des Discours Moraux, Philos. et Polit." In the preface he says: "Le grand chancelier Bacon m'ayant fait naître l'envie de travailler à ces emblèmes ... m'en a fourni les principaux que j'ai tirés de l'explication ingénieuse qu'il a donnée de quelques fables et de ses autres ouvrages." Here is definite evidence of Bacon's association with a book of emblems.

The first volume of Emblemata in which traces of Bacon's hand are to be found is the 1577 edition of Alciat's "Emblems," published by the Plantin Press, with notes by Claude Mignault. It is in this edition, in Emblem No. 45, "In dies meliora," that for the first time the light A and the dark A is to be found. In previous editions this device is absent. For this volume a new design has been engraved in which it appears.

In the emblem books written in Italian Bacon does not appear to have been concerned, unless an exception be made of Ripa's "Iconologia," a copy of which contains his handwriting and initials. In some way he had control of a large number of those written in Latin, and bearing names of Dutch, French, and some Italian authors, and also of several written in Dutch and of the English writers. The field is a very wide one, and only a few of the principal examples can be mentioned.

The most important work is the “Emblemata Moralia et Bellica” of Jacob à Bruck, of Angermundt, 1615. “Argentorati per Jacobum ab Heyden.” With many of the designs in this volume Oliver Lector has dealt fully in “Letters from the Dead to the Dead,”[44] before referred to. There is another volume bearing the name of Jacob à Bruck, published in 1598. Only one copy of this book is known to be in existence, and that is in the Royal Library of St. Petersburg.

The “Emblemata Ethico Politica of Jacobus Bornitius, 1659, Moguntiæ,” is remarkable because many of the engravings contain portraits of Bacon, namely, in Sylloge Prima, Plates Nos. vii., xxiii., xliv., xlv., xlvix.; and in Sylloge II., Plates ix. and xxxvi. Oliver Lector says: “I have not met with an earlier edition of Bornitius than 1659. My conjecture, however, is that the manuscript came into the hands of Gruter with other of Bacon’s published by him in the year 1653.”

There are two productions of Janus Jacobus Boissardus in which Bacon’s hand may be recognised— “Emblèmes Latines avec l’Interprétation Françoise du I. Pierre Ioly Messin. Metis, 1588,” and “Emblematum liber. Ipsa Emblemata ab Auctore delineata: a Theodoro de Bry sculpta et nunc recens in lucem edita,” 1593, Frankfort. Two editions of the latter were printed in the same year. The title-pages are identical, and the same plates have been used throughout, but the letterpress is in Latin in the one, and in French in the other. In both, the dedications are addressed in French to Madame de Clervent, Baronne de Coppet, *etc.* The dedication of the former bears the name Jan Jacques Boissard at the head, and addresses the lady as “que come estes addonnée à la speculation des choses qui appartiennent à l’instruction de l’âme.” The dedication of the latter is signed Ioly, who explains that he has translated the verses into French, so that they may be of more service to the dedicatee.

Otho Van Veen enjoys the distinction of having had Rubens for a disciple. A considerable number of emblem books emanated from him. In 1608 were published at Antwerp two editions of his “Amorum Emblemata.” In one copy the verses are in Latin, German, and French, and in the other in Latin, English, and Italian. There are commendatory verses in the latter, two of which are by

Daniel Heinsius and R. V., who was Robert Verstegen, the author of "A Restitution of Decayed Intelligence in Antiquities." The dedication is "To the most honourable and worthie brothers William Earle of Pembroke, and Phillip Earle of Montgomerie, patrons of learning and chevalrie," who are "the most noble and incomparable paire of brethren" to whom the 1623 Shakespeare Folio was dedicated. In this volume Bacon has left his marks.

"Emblemata door Zacharias Heyns," published in Rotterdam in 1625, comprises four books bound together. The inscriptions over the plates are in Latin. The letterpress, which is in Dutch and French, apparently bears very little reference to the illustrations.

Johannis de Brunes I.C. Emblemata of Sinne-Werck, Amsterdam, 1624, is written in Dutch. Emblem VIII. contains an indication that the number 1623 is a key.

The "Silenus Alcibiades sive Proteus" was published at Middleburgh in 1618. There is no author's name on the title-page, but the Voor-reden, written in Dutch, is signed J. Cats. Attached to two of the preliminary complimentary verses are the names of Daniel Heyns and Josuah Sylvester, the translator of "Du Bartas." The verses are in Latin, Dutch, and French. Immediately following the title-page is a preface in Latin, signed by Majores de Baptis. Over this is the familiar emblem containing the archers, rabbits, and dogs, with the note of query on the right-hand side, and the message on the arrow. This volume is one of the most remarkable of the emblem books. The Latin preface is autobiographical. If the writer can be identified as the author of "Venus and Adonis," it becomes one of the most important contributions to his biography.

In 1616, the year of Shakespeare's death, was published at Amsterdam a book bearing on its title-page the inscription: "Cornelii Giselberti Plempii Amsterodamum Monogrammon." It contains fifty illustrations, with Latin verses attached. Emblem I. is reproduced (Fig. V.) On reference to it, it will be seen that Fortune stands on a globe, and with one hand is pushing off from the pinnacle of fame a man dressed as a player with a feather in his hat; with the other hand she is raising up a man who is wearing the Bacon hat, but whose face

is hidden. The prophecy expressed by the emblem is now being fulfilled. It will be seen that the initial letters of each word in the sentence of the letterpress — Obscænùmque nimis crepuit, Fortuna Batavis appellanda — yield F. Bacon. Bacon's portrait is found in several of the illustrations in this book. Other emblem writers whose works bear traces of Bacon's co-operation are G. Rollenhagen, J. Camerius, J. Typotius, D. Hensius.

Fig. V.

Fig. V.

En Fortuna: manu quos rupem ducit in altam,
Præcipites abigit: carnificina Dea est.
Firma globo imponi voluerunt fata caducam,
Ipsa quoquè ut posset risus, & esse iocus.
Olim unctos Salÿ qui præsilière per utres,

Ridebant caderet si qua puella malè.
O quàm sæpe sales, plausumque merente ruinâ,
Erubuit vitium fors inhonest a suum!
Obscænùmque nimis crepuit, Fortuna Batavis
Appellanda; sono, quo sua curta vocant.
Quoque sono veteres olim sua furta Latini:
Vt nec, Homere, mali nomen odoris ames.

There yet remain to be mentioned two English emblem writers. A "Choice of Emblems" by Geffrey Whitney was published in 1586 by Francis Raphelengius in the house of Christopher Plantin at Leyden. The dedication is to Robert Earle of Leicester. There are only from fifteen to twenty original designs out of 166 illustrations. The remainder are taken from other emblem writers, chiefly from Alciat, Sambucus, Paradin, and Hadrian Junius. On page 53 is the design headed "In dies meliora" found in the 1577 edition of Alciat, but the letterpress, which is in English, is quite different from the Latin verse attached to it in the Alciat.

The "Minerva Britanna" of Henry Peacham was published in 1612. The emblem on the title-page[45] represents the great secret of Francis Bacon's life, and on page ·33 is an emblem in which the name Shakespeare is represented. The volume is full of devices which will amply repay a careful study.

Apart from any connection which Bacon may have had with this remarkable class of books, they are of great interest to the student of the Elizabethan and Jacobean periods. They contain pictorial representations full of information as to the habits and customs of the people. With the exception of Whitney's "Choice of Emblems," a facsimile reprint of which was published in 1866, edited by the Rev. Henry Green, no reprint of any of these curious books has been issued. As the original editions of many of them are very rare, and of none of them plentiful, their study is a matter of difficulty, and few students find their way to this fascinating field of research. How close Bacon's connection was with the writers of these books, or with their publishers, it is difficult to say, but there is

considerable evidence that in some way he was able to introduce into every one of the books here enumerated, and many others, some plates illustrative of his inductive philosophy.

Chapter XX. SHAKESPEARE'S SONNETS.

"Shakespeare's Sonnets never before Imprinted," have afforded commentators material for many volumes filled with theories which to the ordinary critical mind appear to have no foundation in fact. Chapters have been written to prove that Mr. W. H., the only begetter of the Sonnets, was Henry Wriothesley, Earl of Southampton, and chapters have been written to prove that he was no such person, but that William Herbert, Earl of Pembroke, was the man intended to be designated. Theories have been elaborated to identify the individuals represented by the Rival Poet and the dark Lady. Not one of these theories is supported by the vestige of a shred of testimony that would stand investigation. There has not come down any evidence that Shakspur, of Stratford, knew either the Earl of Southampton, the Earl of Pembroke or Marie Fitton. The truth is that Mr. W. H. was *Shakespeare*, who *was* the only begetter of the Sonnets, and the proof of this statement will in due time be forthcoming. It may be well to try and read some of the Sonnets as they stand and endeavour to realise what is the obvious meaning of the printed words.

The key to the Sonnets will be found in No. 62. The language in which it is written is explicit and capable of being understood by any ordinary intellect.

"Sinne of selfe-love possesseth al mine eie
And all my soule, and al my every part;
And for this sinne there is no remedie,
It is so grounded inward in my heart.
Me thinkes no face so gratious is as mine,
No shape so true, no truth of such account,
And for my selfe mine owne worth do define,
As I all other in all worth's surmount
But when my glasse shewes me my selfe indeed
Beated and chopt with tand antiquitie,
Mine own selfe love quite contrary I read

Mine own selfe love quite contrary I read
Selfe, so selfe loving were iniquity.
Tis thee (myselfe) that for myself I praise
Painting my age with beauty of thy daies."

The writer here states definitely that he is dominated by the sin of self-love; it possesseth his eye, his soul, and every part of him. There can be found no remedy for it; it is so grounded in his heart. No face is so gracious as is his, no shape so true, no truth of such account. He defines his worth as surmounting that of all others. This is the frank expression of a man who not only believed that he was, but knew that he was superior to all his contemporaries, not only in intellectual power, but in personal appearance. Then comes an arrest in the thought, and he realises that time has been at work. He has been picturing himself as he was when a young man. He turns to his glass and sees himself beated and chopt with tanned antiquity; forty summers have passed over his brow.[46]

Francis Bacon at forty years of age, or thereabouts, unmarried, childless, sits down to his table, Hilliard's portrait before him, with pen in hand, full of self-love, full of admiration for that beautiful youth on whose counterfeit presentment he is gazing. His intellectual triumphs pass in review before him, most of them known only to himself and that youth — his companion through life. That was the Francis Bacon who controlled him in all his comings and goings — his ideal whom he worshipped. If he could have a son like that boy! His pen begins to move on the paper —

"From fairest creatures we desire increase
That thereby beauty's rose might never die,
But as the riper should by time decrease
His tender heire might bear his memory."

The pen stops and the writer's eye wanders to the miniature: —
"But *thou*[47] contracted to thine own bright eyes."

And so the Sonnets flow on, without effort, without the need of reference to authorities, for the great, fixed and methodical memory needs none.

How natural are the allusions —

“Thou art thy mother’s glasse and she in thee
Calls backe the lovely Aprill of her prime.”

“Be as thy presence is, gracious and kind,
Or to thyselfe at least kind hearted prove.
Make thee another self, for love of me
That beauty may still live in thine or thee.”

“Let those whom nature hath not made for store,
Harsh, featureless and rude, barrenly perish;
Look, whom she best indow’d she gave the more;
Which bountious guift thou shouldst in bounty cherrish;
She carv’d thee for her seale, and ment therby
Thou shouldst print more, not let that coppy die.”

“O that you were yourselfe, but love you are
No longer yours, then you yourselfe here live,
Against this cunning end you should prepare,
And your sweet semblance to some other give
. . . . . .
Who lets so faire a house fall to decay
. . . . . .

O none but unthrifts, deare my love you know
You had a Father, let your Son say so.”

“But wherefore do not you a mightier waie
Make warre uppon this bloodie tirant Time?
And fortifie your selfe in your decay
With meanes more blessed, then my barren rime?
Now stand you on the top of happie houres
And many maiden gardens, yet onset,
With virtuous wish would beare you living flowers
Much liker than your painted counterfeit:

Who will beleeve my verses in time to come
If it were fil’d with your most high deserts?
Though yet heaven knows, it is but as a tombe
Which hides your life, and shewes not halfe your parts:
If I could write the beauty of your eyes
And in fresh numbers number all your graces,
The age to come would say this Poet lies,
Such heavenly touches nere toucht earthly faces.
So should my papers (yellowed with their age)
Be scorn’d, like old men of lesse truth than tongue,
And your true rights be termd a Poets rage
And stretched miter of an Antique song.
But were some childe of yours alive that time,
You should live twise, in it and in my rime.”

“Yet doe thy worst, ould Time, dispight thy wrong
My love shall in my verse ever live young.”

He realises that he no longer answers Ophelia’s description:

“The courtier’s, soldier’s, scholar’s eye, tongue, sword:
The expectancy and rose of the fair state
The glass of fashion and the mould of form,
The observed of all observers....
That unmatch’d form and feature of blown youth.”

But he cannot forget what he has been, he cannot realise that he is no longer the brilliant youth whose miniature he has before him, with the words inscribed around, “Si tabula daretur digna animum mallem” — If materials could be found worthy to paint his mind (“O could he but have drawn his wit”) and then with a burst of poetic enthusiasm he exclaims: —

“Tis thee (myselfe) that for myselfe I praise,
Painting my age with beauty of thy daies.”

This is the common experience of a man as he advances in life. So long as he does not see his reflection in a glass, if he tries to visualize himself, he sees the youth or young man. Only in his most pessimistic moments does he realise his age.

There is no longer any difficulty in understanding Shakespeare’s Sonnets. They were addressed by “Shakespeare,” the poet, to the marvellous youth who was known under the name of Francis Bacon, and they were written, with Hilliard’s portrait placed on his table before him.

In that age (please God it may be the present age), which is known only to God and to the fates when the finishing touch shall be given to Bacon’s fame,[48] it will be found that the period of his life from twelve to thirty-five years of age

surpassed all others, not only in brilliant intellectual achievements, but for the enduring wealth with which he endowed his countrymen. And yet it was part of his scheme of life that his connection with the great renaissance in English literature should lie hidden until posterity should recognise that work as the fruit of his brain:— "Mente Videbor"— "by the mind I shall be seen."

How lacking all his modern biographers have been in perception!

Every difficulty in those which are termed the procreation Sonnets disappears with the application of this key. Only by it can Sonnet 22 be made intelligible: —

"My glass shall not persuade me I am old,
As long as youth and thou are of one date;
But when in thee time's furrow I behold,
Then look, I death my days would expirate
For all that beauty that doth cover thee
Is but the steady raiment of my heart.
Which in my breast doth live, as thine in me.
How can I then be older than thou art?
O, therefore, love, be of thyself so wary
As I, not for myself, but for thee will;
Bearing thy heart, which I will keep so chary
As tender nurse her babe from faring ill.
Presume not on thy heart when mine is slain;
Thou gavest me thine, not to give back again."

But nearly every Sonnet might be quoted in support of this view. Especially is it of value in bringing an intelligent and allowable explanation to Sonnets 40, 41, and 42, which now no longer have an unsavoury flavour.

Sonnet No. 59 is most noteworthy, because it implies a belief in re-incarnation. Shakespeare expresses his longing to know what the ancients would have said of his marvellous intellect. If he could find his picture in some antique

book over 500 years old, see an image of himself as he then was, and learn what men thought of him!

"If their bee nothing new, but that which is
Hath beene before, how are our braines begulld,
Which laboring for invention, beare amisse
The second burthen of a former child?
Oh that record could with a back-ward looke,
Even of five hundredth courses of the Sunne,
Show me your image in some antique booke,
Since minde at first in carrecter was done,
That I might see what the old world could say
To this composed wonder of your frame;
Whether we are mended, or where better they,
Or whether revolution be the same.
Oh sure I am, the wits of former daies,
To subjects worse have given admiring praise."

There is the same idea in Sonnet 71, which suggests that in some future re-incarnation Bacon might read Shakespeare's praises of him.

Conjectures as to who was the rival poet may be dispensed with. The following rendering of Sonnet No. 80 makes this perfectly clear: —

"O how I (*the poet*) faint when I of you (*F.B.*) do write,
Knowing a better spirit (*that of the philosopher*) doth use your name
And in the praise thereof spends all his might
To make me tongue tied, speaking of your fame!
(*Shakespeare never refers to Bacon or vice-versa*)
But since your (*F.B.'s*) worth wide as the ocean is,
The humble as the proudest sail doth bear,
My saucy bark (*that of the poet*) inferior far to his (*that of the philosopher*),

On your broad main doth wilfully appear.
Your shallowest help will hold me (*the poet*) up afloat
Whilst he (*the philosopher*) upon your soundless deep doth ride."

It is impossible to do justice to this subject in the space here available. By the aid of this key every line becomes intelligible. The charm and beauty of the Sonnets are increased tenfold. Every unpleasant association of them is removed. No longer need Browning say, "If so the less Shakespeare he."

These are not "Shakespeare's sug'rd[49] Sonnets amongst his private friends" to which Meres makes reference. They are to be found elsewhere.

If there had been an intelligent study of Elizabethan literature from original sources the authorship of the Sonnets would have been revealed long ago. It was a habit of Bacon to speak of himself as some one apart from the speaker. The opening sentence of *Filum Labyrinthi, Sivo Forma Inquisitiones* is an example. *Ad Filios*— "Francis Bacon thought in this manner." Prefixed to the preface to Gilbert Wats' interpretation of the "Advancement of Learning" is a chapter commencing, "Francis Lo Verulam consulted thus: and thus concluded with himselfe. The publication whereof he conceived did concern the present and future age."

Nothing that has been written is more perfectly Baconian in style and temperament than are the Sonnets. They breathe out his hopes, his aspirations, his ideals, his fears, in every line. He knew he was not for his time. He knew future generations only would render him the fame to which his incomparable powers entitled him. He knew how far he towered above his contemporaries, aye, and his predecessors, in intellectual power. His hopes were fixed on that day in the distant future — to-day — when for the first time the meshes which he wove, behind which his life's work is obscured, are beginning to be unravelled.

The most sanguine Baconian, in his most enthusiastic moments, must fail adequately to appreciate the achievements of Francis Bacon and the obligations under which he has placed posterity. But Bacon knew — and he alone knew — their full value. It was fitting that the greatest poet which the world had produced

should in matchless verse do honour to the world's greatest intellect. It was a pretty conceit. Only a master mind would dare to make the attempt. The result has afforded another example of how his great wit, in being concealed, was revealed.

Chapter XXI. BACON'S LIBRARY.

In the "Advancement of Learning" Bacon refers to the annotations of books as being deficient. There was living at the end of the sixteenth and beginning of the seventeenth century a scholar through whose hands at least several thousand books passed. He appears to have made a practice of annotating in the margins every book he read. The chief purpose, however, of the notes, apparently, was to aid the memory, for in some books nearly every name occurring in the text is carried into the margin without comment. The notes are also accompanied by scrolls, marks, and brackets, which support the contention that they are the work of one man. The annotation of books was not a common practice then, nor has it been since. If a reader takes up a hundred books in a second-hand book shop he will probably not find more than one containing manuscript notes, and not one in five hundred in which the annotations have been systematically carried through. There does not appear to have been any other scholar living at that time, with the exception of this one, who was persistently making marginal notes on the books he read.

Spedding writes: "What became of his (Bacon's) books, which were left to Sir John Constable and must have contained traces of his reading, we do not know; but very few appear to have survived."

Mrs. Pott, in "Francis Bacon and his Secret Society," draws attention to the mystery as to the disappearance of Bacon's library. "Which is a mystery," she adds, "although the world has been content to take it very apathetically. Where is Bacon's library? Undoubtedly the books exist and are traceable. We should expect them to be recognisable by marginal notes; yet those notes, whether in pencil or in ink, may have been effaced. If annotated, Bacon and his friends would not wish his books to attract public attention." And further on: "It is probable that the latter (*i.e.*, the books) will seldom or never be found to bear his name or signature." And again: "Yet it may reasonably be anticipated that some at least are 'noted in the margin,' or that some will be found with traces of marks

which were guides to the transcriber or amanuensis as to the portions which were to be copied for future use in Bacon's collections or book of commonplaces." Mrs. Pott's words were written in a spirit of true prophecy.

The collecting together of these books originated with that distinguished Baconian scholar, Mr. W. M. Safford. For years past he has been steadily engaged in reconstituting Bacon's Library. The writer has had the privilege of being associated with him in this work during the past three years. A collection of nearly two thousand volumes has been gathered together. The annotations on the margins of these books are unquestionably the work of one man, and that man, or rather boy and man, was undoubtedly Francis Bacon. The books bear date from 1470 to 1620. It is impossible to enumerate them all here, but they include the works of Seneca, Aristotle, Plato, Horace, Alciat, Lucanus, Dionysius, Catullus, Lactinius, Plutarch, Pliny, Aristophanes, Plautus, Cornelius Agrippa, Cicero, Vitruvius, Euclid, Virgil, Ovid, Lucretius, Apuleius, Salust, Tibullus, Isocrates, and hundreds of other classical writers; St. Augustine, St. Jerome, Calvin, Beza, Beda, Erasmus, Martin Luther, J. Cammerarius, Sir Thomas Moore, Machiavelli, and other more modern writers.

The handwriting varies,[50] but there is a particular hand which is found accompanied by a boy's sketches. There are drawings of full-length figures, heads of men and women, animals, birds, reptiles, ships, castles, cathedrals, cities, battles, storms, *etc.* The writing is a strong, clerkly student's hand. There is a passage in "Hamlet," Act V., scene ii., which is noteworthy. Hamlet, speaking to Horatio, says: —

"I sat me down
Devised a new commission; wrote it fair;
I once did hold it, as our statists do,
A baseness to write fair, and labour'd much
How to forget that learning; but, Sir, now
It did me yeomans service."

The nature of this statement is so personal that it could only have been written as the result of experience. Hamlet had been taught, when young, to write a hand so fair that he was capable of producing a fresh commission which would pass muster as the work of a Court copyist. The annotation of these books possessed the same qualification. In the margins of these books are abundant references in handwriting to the whole range of classical authors.

A copy of the "Grammatice Compendium" of Lactus Pomponius, a very rare book printed by De Fortis in Venice in 1484, contains on the margins the boy's scribble and drawings, besides a number of manuscript notes. It bears traces of his reading probably at eight years of age. A large folio volume entitled "T. Livii Palvini Latinæ Historiæ Principis Decades Tres," published by Frobenius in 1535, is a treasure. It is most copiously annotated and embellished with sketches. The notes are usually in Latin, but interspersed with Greek and sometimes with English. Obviously the writer thought in Latin, and the character of the drawings justifies the assumption that, at the time, his age would be from ten to fourteen years.

The most remarkable reference to these annotations is to be found in the "Rape of Lucrece." The fifteenth stanza is as follows: —

"But she that never cop't with straunger eies,
Could picke no meaning from their parling lookes,
Nor read the subtle shining secrecies
Writ in the glassie margents of such bookes,
Shee toucht no unknown baits, nor feared no hooks,
Nor could shee moralize his wanton sight
More than his eies were opend to the light."

It would be difficult to conceive a more inappropriate simile for the lustful looks in Tarquin's eyes than "the subtle shining secrecies, writ in the glassie margents of such books." That this is lugged in for a purpose outside the object

of the poem is manifest. How many readers of "Lucrece" would know of such a practice? Nay. If it did exist, was not its use very rare?

But the margin of the verse itself yields a subtle shining secret! The initial letters of the lines are B, C, N, W, Sh, N, M. It is only necessary to supply the vowels — BACoN, W. Sh., NaMe. Sh is on line 103, which is the numerical value of the word Shakespeare. The numerical value of Bacon is 33. In view of this the line 33 is significant:— "Why is Colatine the publisher?" The use of the word *publisher* here is quite inappropriate. It is introduced for some reason outside the purpose of the text.

The "Rape of Lucrece" commences with Bacon's monogram and, as the late Rev. Walter Begley pointed out, ends with his signature.

The theory now advanced is that when Bacon read a book he made marginal notes in it — the object being mainly to assist his memory, but the critical notes are numerous. It does not follow that all these books constituted his library. He would read a book and it having served his purpose he would dispose of it. Some books no doubt he would retain and these would form his library.

The annotations are chiefly in Latin, but some are in Greek, some in Hebrew, French and Spanish. When these have been examined and translated the meaning of the phrase that he had taken all knowledge to be his province will be better understood. Rawley says: "He read much and that with great judgment and rejection of impertinences incident to many authors."

The writer having examined annotations, many and varied, of books in his library, and having enjoyed the privilege of free access to those collected by Mr. Safford, ventures to assert that much of the ripe learning of the Shakespeare plays can be traced therein to its proper origin. Amongst the former is a copy of Alciat's Emblems, 1577, in the early part profusely annotated. Ben Jonson in his "Discoveries" has incorporated the translation of a portion of one of the Emblems and *has also incorporated a portion of the annotations from this very book.*

Chapter XXII. TWO GERMAN OPINIONS ON SHAKESPEARE AND BACON.

Dr. G. G. Gervinus, the eminent German Historian and Professor Extraordinary at Heidelberg, published in 1849 his work, “Shakespeare Commentaries.” This was years before any suggestion had been made that Bacon was in any way connected with the authorship of the Shakespearean dramas.

In the Prospectus of “The New Shakespeare Society,” written in 1873, Dr. F. J. Furnivall says: —

“The profound and generous ‘Commentaries’ of Gervinus — an honour to a German to have written, a pleasure to an Englishman to read — is still the only book known to me that comes near the true treatment and the dignity of its subject, or can be put into the hands of the student who wants to know the mind of Shakespeare.”

The book abounds with references to Bacon. From the Preface to the last chapter Gervinus appears to have Bacon continually suggested to him by the thoughts and words of Shakespeare.

In the Preface, after speaking of the value accruing to German literature by naturalizing Shakespeare “even at the risk of casting our own poets still further in the shade,” he says: —

“A similar benefit would it be to our intellectual life if his famed contemporary, Bacon, were revived in a suitable manner, in order to counterbalance the idealistic philosophy of Germany. For both these, the poet as well as the philosopher, having looked deeply into the history and politics of their people, stand upon the level ground of reality, notwithstanding the high art of the one and the speculative notions of the other. By the healthfulness of their own mind they influence the healthfulness of others, while in their most ideal and most abstract representations they aim at a preparation for life *as it is* — for *that* life which forms the exclusive subject of all political action.”

In the chapter on “His Age,” written prior to 1849, the Professor pours out the results of a profound study of the writings attributed to both men in the following remarkable sentences: —

“Judge then how natural it was that England, if not the birthplace of the drama, should be that of dramatic legislature. Yet even this instance of favourable concentration is not the last. Both in philosophy and poetry everything conspired, as it were, throughout this prosperous period, in favour of two great minds, Shakespeare and Bacon; all competitors vanished from their side, and they could give forth laws for art and science which it is incumbent even upon present ages to fulfil. As the revived philosophy, which in the former century in Germany was divided among many, but in England at that time was the possession of a single man, so poetry also found one exclusive heir, compared with whom those later born could claim but little.

“That Shakespeare’s appearance upon a soil so admirably prepared was neither marvellous nor accidental is evidenced even by the corresponding appearance of such a contemporary as Bacon. Scarcely can anything be said of Shakespeare’s position generally with regard to mediæval poetry which does not also bear upon the position of the renovator Bacon with regard to mediæval philosophy. Neither knew nor mentioned the other, although Bacon was almost called upon to have done so in his remarks upon the theatre of his day. It may be presumed that Shakespeare liked Bacon but little, if he knew his writings and life; that he liked not his ostentation, which, without on the whole interfering with his modesty, recurred too often in many instances; that he liked not the fault-finding which his ill-health might have caused, nor the narrow-mindedness with which he pronounced the histrionic art to be infamous, although he allowed that the ancients regarded the drama as a school for virtue; nor the theoretic precepts of worldly wisdom which he gave forth; nor, lastly, the practical career which he lived. Before his mind, however, if he had fathomed it, he must have bent in reverence. For just as Shakespeare was an interpreter of the secrets of history and of human nature, Bacon was an interpreter of lifeless nature. Just as Shakespeare went from instance to instance in his judgment of moral actions,

and never founded a law on single experience, so did Bacon in natural science avoid leaping from one experience of the senses to general principles; he spoke of this with blame as anticipating nature; and Shakespeare, in the same way, would have called the conventionalities in the poetry of the Southern races an anticipation of human nature. In the scholastic science of the middle ages, as in the chivalric poetry of the romantic period, approbation and not truth was sought for, and with one accord Shakespeare's poetry and Bacon's science were equally opposed to this. As Shakespeare balanced the one-sided errors of the imagination by reason, reality, and nature, so Bacon led philosophy away from the one-sided errors of reason to experience; both with one stroke, renovated the two branches of science and poetry by this renewed bond with nature; both, disregarding all by-ways, staked everything upon this 'victory in the race between art and nature.' Just as Bacon with his new philosophy is linked with the natural science of Greece and Rome, and then with the latter period of philosophy in western Europe, so Shakespeare's drama stands in relation to the comedies of Plautus and to the stage of his own day; between the two there lay a vast wilderness of time, as unfruitful for the drama as for philosophy. But while they thus led back to nature, Bacon was yet as little of an empiric, in the common sense, as Shakespeare was a poet of nature. Bacon prophesied that if hereafter his commendation of experience should prevail, great danger to science would arise from the other extreme, and Shakespeare even in his own day could perceive the same with respect to his poetry; Bacon, therefore, insisted on the closest union between experience and reason, just as Shakespeare effected that between reality and imagination. While they thus bid adieu to the formalities of ancient art and science, Shakespeare to conceits and taffeta-phrases, Bacon to logic and syllogisms, yet at times it occurred that the one fell back into the subtleties of the old school, and the other into the constrained wit of the Italian style. Bacon felt himself quite an original in that which was his peculiar merit, and so was Shakespeare; the one in the method of science he had laid down, and in his suggestions for its execution, the other in the poetical works he had executed, and in the suggestions of their new law. Bacon, looking back to the waymarks he

had left for others, said with pride that his words required a century for their demonstration and several for their execution; and so too it has demanded two centuries to understand Shakespeare, but very little has ever been executed in his sense. And at the same time we have mentioned what deep modesty was interwoven in both with their self-reliance, so that the words which Bacon liked to quote hold good for the two works:— 'The kingdom of God cometh not with observation.' Both reached this height from the one starting point, that Shakespeare despised the million, and Bacon feared with Phocion the applause of the multitude. Both are alike in the rare impartiality with which they avoided everything one-sided; in Bacon we find, indeed, youthful exercises in which he endeavoured in severe contrasts to contemplate a series of things from two points of view. Both, therefore, have an equal hatred of sects and parties; Bacon of sophists and dogmatic philosophers, Shakespeare of Puritans and zealots. Both, therefore, are equally free from prejudices, and from astrological superstition in dreams and omens. Bacon says of the alchemists and magicians in natural science that they stand in similar relation to true knowledge as the deeds of Amadis to those of Cæsar, and so does Shakespeare's true poetry stand in relation to the fantastic romance of Amadis. Just as Bacon banished religion from science, so did Shakespeare from Art; and when the former complained that the teachers of religion were against natural philosophy, they were equally against the stage. From Bacon's example it seems clear that Shakespeare left religious matters unnoticed on the same grounds as himself, and took the path of morality in worldly things; in both this has been equally misconstrued, and Le Maistre has proved Bacon's lack of Christianity, as Birch has done that of Shakespeare. Shakespeare would, perhaps, have looked down just as contemptuously on the ancients and their arts as Bacon did on their philosophy and natural science, and both on the same grounds; they boasted of the greater age of the world, of more enlarged knowledge of heaven, earth, and mankind. Neither stooped before authorities, and an injustice similar to that which Bacon committed against Aristotle, Shakespeare *perhaps* has done to Homer. In both a similar combination of different mental powers was at work; and as Shakespeare

was often involuntarily philosophical in his profoundness, Bacon was not seldom surprised into the imagination of the poet. Just as Bacon, although he declared knowledge in itself to be much more valuable than the use of invention, insisted throughout generally and dispassionately upon the practical use of philosophy, so Shakespeare's poetry, independent as was his sense of art, aimed throughout at bearing upon the moral life. Bacon himself was of the same opinion; he was not far from declaring history to be the best teacher of politics, and poetry the best instructor in morals. Both were alike deeply moved by the picture of a ruling Nemesis, whom they saw, grand and powerful, striding through history and life, dragging the mightiest and most prosperous as a sacrifice to her altar, as the victims of their own inward nature and destiny. In Bacon's works we find a multitude of moral sayings and maxims of experience, from which the most striking mottoes might be drawn for every Shakespearian play, aye, for every one of his principal characters (we have already brought forward not a few proofs of this), testifying to a remarkable harmony in their mutual comprehension of human nature. Both, in their systems of morality rendering homage to Aristotle, whose ethics Shakespeare, from a passage in Troilus, may have read, arrived at the same end as he did — that virtue lies in a just medium between two extremes. Shakespeare would also have agreed with *him* in this, that Bacon declared excess to be 'the fault of youth, as defect is of age;' he accounted 'defect the worst, because excess contains some sparks of magnanimity, and, like a bird, claims kindred of the heavens, while defect, only like a base worm, crawls upon the earth.' In these maxims lie at once, as it were, the whole theory of Shakespeare's dramatic forms and of his moral philosophy."

Dr. Kuno Fischer, the distinguished German critic and historian of philosophy, in a volume on Bacon, published in 1856, writes: —

The same affinity for the Roman mind, and the same want of sympathy with the Greek, we again find in Bacon's greatest contemporary, whose imagination took as broad and comprehensive a view as Bacon's intellect. Indeed, how could a Bacon attain that position with respect to Greek poetry that was unattainable by the mighty imagination of a Shakspeare? For in Shakspeare, at any rate, the

imagination of the Greek antiquity could be met by a homogeneous power of the same rank as itself; and, as the old adage says, “like comes to like.” But the age, the spirit of the nation — in a word, all those forces of which the genius of an individual man is composed, and which, moreover, genius is least able to resist — had here placed an obstacle, impenetrable both to the poet and the philosopher. Shakspeare was no more able to exhibit Greek characters than Bacon to expound Greek poetry. Like Bacon, Shakspeare had in his turn of mind something that was Roman, and not at all akin to the Greek. He could appropriate to himself a Coriolanus and a Brutus, a Cæsar and an Antony; he could succeed with the Roman heroes of Plutarch, but not with the Greek heroes of Homer. The latter he could only parody, but his parody was as infelicitous as Bacon’s explanation of the “Wisdom of the Ancients.” Those must be dazzled critics indeed who can persuade themselves that the heroes of the Iliad are excelled by the caricatures in “Troilus and Cressida.” The success of such a parody was poetically impossible; indeed, he that attempts to parody Homer shows thereby that he has not understood him. For the simple and the naïve do not admit of a parody, and these have found in Homer their eternal and inimitable expression. Just as well might caricatures be made of the statues of Phidias. Where the creative imagination never ceases to be simple and naïve, where it never distorts itself by the affected or the unnatural, there is the consecrated land of poetry, in which there is no place for the parodist. On the other hand, where there is a palpable want of simplicity and nature, parody is perfectly conceivable; nay, may even be felt as a poetical necessity. Thus Euripides, who, often enough, was neither simple nor naïve, could be parodied, and Aristophanes has shown us with what felicity. Even Æschylus, who was not always as simple as he was grand, does not completely escape the parodising test. But Homer is safe. To parody Homer is to mistake him, and to stand so far beyond his scope that the truth and magic of his poetry can no longer be felt; and this is the position of Shakespeare and Bacon. The imagination of Homer, and all that could be contemplated and felt by that imagination, namely, the classical antiquity of the Greeks, are to them utterly foreign. We cannot understand

Aristotle without Plato; nay, I maintain that we cannot contemplate with a sympathetic mind the Platonic world of ideas, if we have not previously sympathised with the world of the Homeric gods. Be it understood, I speak of the *form* of the Platonic mind, not of its logical matter; in point of doctrine, the Homeric faith was no more that of Plato than of Phidias. But these doctrinal or logical differences are far less than the formal and æsthetical affinity. The conceptions of Plato are of Homeric origin.

This want of ability to take an historical survey of the world is to be found alike in Bacon and Shakspeare, together with many excellencies likewise common to them both. To the parallel between them — which Gervinus, with his peculiar talent for combination, has drawn in the concluding remarks to his "Shakespeare," and has illustrated by a series of appropriate instances — belongs the similar relation of both to antiquity, their affinity to the Roman mind, and their diversity from the Greek. Both possessed to an eminent degree that faculty for a knowledge of human nature that at once pre-supposes and calls forth an interest in practical life and historical reality. To this interest corresponds the stage, on which the Roman characters moved; and here Bacon and Shakspeare met, brought together by a common interest in these objects, and the attempt to depict and copy them. This point of agreement, more than any other argument, explains their affinity. At the same time there is no evidence that one ever came into actual contact with the other. Bacon does not even mention Shakspeare when he discourses of dramatic poetry, but passes over this department of poetry with a general and superficial remark that relates less to the subject itself than to the stage and its uses. As far as his own age is concerned, he sets down the moral value of the stage as exceedingly trifling. But the affinity of Bacon to Shakspeare is to be sought in his moral and psychological, not in his æsthetical views, which are too much regulated by material interests and utilitarian prepossessions to be applicable to art itself, considered with reference to its own independent value. However, even in these there is nothing to prevent Bacon's manner of judging mankind, and apprehending characters from agreeing perfectly with that of Shakspeare; so that human life, the subject-matter of all

dramatic art, appeared to him much as it appeared to the great artist himself, who, in giving form to this matter, excelled all others. Is not the inexhaustible theme of Shakspeare's poetry the history and course of human passion? In the treatment of this especial theme is not Shakspeare the greatest of all poets — nay, is he not unique among them all? And it is this very theme that is proposed by Bacon as the chief problem of moral philosophy. He blames Aristotle for treating of the passions in his rhetoric rather than his ethics; for regarding the artificial means of exciting them rather than their natural history. It is to the natural history of the human passions that Bacon directs the attention of philosophy. He does not find any knowledge of them among the sciences of his time. "The poets and writers of histories," he says, "are the best doctors of this knowledge; where we may find painted forth with great life how passions are kindled and incited; and how pacified and refrained; and how again contained from act and further degree; how they disclose themselves; how they work; how they vary; how they gather and fortify; how they are inwrapped one within another; and how they do fight and encounter one with another; and other the like particularities."[51] Such a lively description is required by Bacon from moral philosophy. That is to say, he desired nothing less than a natural history of the passions — the very thing that Shakspeare has produced. Indeed, what poet could have excelled Shakspeare in this respect? Who, to use a Baconian expression, could have depicted man and all his passions more *ad vivum*? According to Bacon, the poets and historians give us copies of characters; and the outlines of these images — the simple strokes that determine characters — are the proper objects of ethical science. Just as physical science requires a dissection of bodies, that their hidden qualities and parts may be discovered, so should ethics penetrate the various minds of men, in order to find out the eternal basis of them all. And not only this foundation, but likewise those external conditions which give a stamp to human character — all those peculiarities that "are imposed upon the mind by the sex, by the age, by the region, by health and sickness, by beauty and deformity, and the like, which are inherent and not external; and, again, those which are caused by external fortune"[52] — should

come within the scope of ethical philosophy. In a word, Bacon would have man studied in his individuality as a product of nature and history, in every respect determined by natural and historical influences, by internal and external conditions. And exactly in the same spirit has Shakespeare understood man and his destiny; regarding character as the result of a certain natural temperament and a certain historical position, and destiny as a result of character.

Chapter XXIII. THE TESTIMONY OF BACON'S CONTEMPORARIES.

A distinguished member of the Bench in a recent post-prandial address referred to Bacon as "a shady lawyer." Irresponsible newspaper correspondents, when attacking the Baconian theory, indulge in epithets of this kind, but it is amazing that any man occupying a position so responsible as that of an English judge should, either through ignorance or with a desire to be considered a wit, make use of such a term.

Whatever may have been Francis Bacon's faults, one fact must stand unchallenged — that amongst those of his contemporaries who knew him there was a consensus of opinion that his virtues overshadowed any failings to which he might be subject.

The following testimonies establish this fact: —

Let Ben Jonson speak first:

"Yet there happened in my time one noble speaker, who was full of gravity in his speaking. His language (where he could spare or pass a jest) was nobly censorious. No man ever spake more neatly, more pressly, more weightily, or suffered less emptiness, less idleness, in what he uttered. No member of his speech, but consisted of his own graces. His hearers could not cough, or look aside from him, without loss. He commanded where he spoke; and had his judges angry and pleased at his devotion. No man had their affections more in his power. The fear of every man that heard him was, lest he should make an end," and, after referring to Lord Ellesmere, Jonson continues: —

"But his learned and able (though unfortunate) successor, (*i.e.*, Bacon) is he who hath filled up all numbers, and performed that in our tongue, which may be compared or preferred either to insolent Greece, or haughty Rome. In short, within his view, and about his times, were all the wits born, that could honour a language, or help study. Now things daily fall, wits grow downward, and

eloquence grows backward: so that he may be named, and stand as the mark and άκωη of our language.

"My conceit of his person was never increased toward him by his place, or honours: but I have and do reverence him, for the greatness that was only proper to himself, in that he seemed to me ever, by his work, one of the greatest men, and most worthy of admiration, that had been in many ages. In his adversity I ever prayed God would give him strength; for greatness he could not want. Neither could I condole in a word or syllable for him, as knowing no accident could do harm to virtue, but rather help to make it manifest."

Sir Toby Matthew describes Francis Bacon as

"A friend unalterable to his friends;
A man most sweet in his conversation and ways";

and adds:

"It is not his greatness that I admire, but his virtue."

Thomas Bushel, his servant, in a letter to Mr. John Eliot, printed in 1628, in a volume called "The First Part of Youth's Errors," says:

"Yet lest the calumnious tongues of men might extenuate the good opinion you had of his worth and merit, I must ingenuously confess that my selfe and others of his servants were the occasion of exhaling his vertues into a darke exlipse; which God knowes would have long endured both for the honour of his King and the good of the Commonaltie; had not we whom his bountie nursed, laid on his guiltlesse shoulders our base and execrable deeds to be scand and censured by the whole senate of a state, where no sooner sentence was given, but most of us forsoke him, which makes us bear the badge of Jewes to this day. Yet I am confident there were some Godly Daniels amongst us.... As for myselfe, with shame I must acquit the title, and pleade guilty; which grieves my very soule, that so matchlesse a Peer should be lost by such insinuating caterpillars, who in his owne nature scorn'd the least thought of any base, unworthy, or ignoble act, though subject to infirmites as ordained to the wisest."

In Fuller's "Worthies" it is written:

"He was a rich Cabinet filled with Judgment, Wit, Fancy and Memory, and had the golden Key, Elocution, to open it. He was singular in singulis, in every Science and Art, and being In-at-all came off with Credit. He was too Bountifull to his Servants, and either too confident of their Honesty, or too conniving at their Falsehood. 'Tis said he had 2 Servants, one in all Causes Patron to the Plaintiff, the other to the Defendant, but taking bribes of both, with this Condition, to restore the Mony received, if the Cause went against them. Such practices, tho' unknown to their Master, cost him the loss of his Office."

In "The Lives of Statesmen and Favourites of Elizabeth's Reign" it is said: —

"His religion was rational and sober, his spirit publick, his love to relations tender, to Friends faithful, to the hopeful liberal, to men universal, to his very Enemies civil. He left the best pattern of Government in his actions under one king and the best principles of it in the Life of the other."

The following is a translation from the discourse on the life of Mr. Francis Bacon which is prefixed to the "Histoire Naturelle," by Piere Amboise, published in Paris in 1631:

"Among so many virtues that made this great man commendable, prudence, as the first of all the moral virtues, and that most necessary to those of his profession, was that which shone in him the most brightly. His profound wisdom can be most readily seen in his books, and his matchless fidelity in the signal services that he continuously rendered to his Prince. Never was there man who so loved equity, or so enthusiastically worked for the public good as he; so that I may aver that he would have been much better suited to a Republic than to a Monarchy, where frequently the convenience of the Prince is more thought of than that of his people. And I do not doubt that had he lived in a Republic he would have acquired as much glory from the citizens as formerly did Aristides and Cato, the one in Athens, the other in Rome. Innocence oppressed found always in his protection a sure refuge, and the position of the great gave them no vantage ground before the Chancellor when suing for justice.

“Vanity, avarice, and ambition, vices that too often attach themselves to great honours, were to him quite unknown, and if he did a good action it was not from the desire of fame, but simply because he could not do otherwise. His good qualities were entirely pure, without being clouded by the admixture of any imperfections, and the passions that form usually the defects in great men in him only served to bring out his virtues; if he felt hatred and rage it was only against evil-doers, to shew his detestation of their crimes, and success or failure in the affairs of his country brought to him the greater part of his joys or his sorrows. He was as truly a good man as he was an upright judge, and by the example of his life corrected vice and bad living as much as by pains and penalties. And, in a word, it seemed that Nature had exempted from the ordinary frailities of men him whom she had marked out to deal with their crimes. All these good qualities made him the darling of the people and prized by the great ones of the State. But when it seemed that nothing could destroy his position, Fortune made clear that she did not yet wish to abandon her character for instability, and that Bacon had too much worth to remain so long prosperous. It thus came about that amongst the great number of officials such as a man of his position must have in his house, there was one who was accused before Parliament of exaction, and of having sold the influence that he might have with his master. And though the probity of Mr. Bacon was entirely exempt from censure, nevertheless he was declared guilty of the crime of his servant and was deprived of the power that he had so long exercised with so much honour and glory. In this I see the working of monstrous ingratitude and unparalleled cruelty — to say that a man who could mark the years of his life rather by the signal services that he had rendered to the State than by times or seasons, should have received such hard usage for the punishment of a crime which he never committed; England, indeed, teaches us by this that the sea that surrounds her shores imparts to her inhabitants somewhat of its restless inconstancy. This storm did not at all surprise him, and he received the news of his disgrace with a countenance so undisturbed that it was easy to see that he thought but little of the sweets of life since the loss of them caused

him discomfort so slight." Thus ended this great man whom England could place alone as the equal of the best of all the previous centuries."

Peter Boener, who was private apothecary to Bacon for a time, wrote in 1647 a Life, of portions of which the following are translations: —

"But how runneth man's future. He who seemed to occupy the highest rank is alas! by envious tongues near King and Parliament deposed from all his offices and chancellorship, little considering what treasure was being cast in the mire, as afterwards the issue and result thereof have shown in that country. But he always comforted himself with the words of Scripture — nihil est novi; that means 'there is nothing new.' Because so is Cicero by Octavianus; Calisthenes by Alexander; Seneca (all his former teachers) by Nero; yea, Ovid, Lucanus, Statius (together with many others), for a small cause very unthankfully the one banished, the other killed, the third thrown to the lions. But even as for such men banishment is freedom — death their life, so is for this author his deposition a memory to greater honour and fame, and to such a sage no harm can come.

"Whilst his fortunes were so changed, I never saw him — either in mien, word or acts — changed or disturbed towards whomsoever; *ira enim hominis non implet justitiam Dei*, he was ever one and the same, both in sorrow and in joy, as becometh a philosopher; always with a benevolent allocution — *manus nostræ sunt oculatæ, credunt quod vident*.... A noteworthy example and pattern for everyone of all virtue, gentleness, peacefulness, and patience."

Francis Osborn, in his "Advice to a Son," writes: —

"And my memory neither doth nor (I believe possible ever) can direct me towards an example more splendid in this kind, than the Lord Bacon Earl of St. Albans, who in all companies did appear a good Proficient, if not a Master in those Arts entertained for the Subject of every ones discourse. So as I dare maintain, without the least affectation of Flattery or Hyperbole, That his most casual talk deserveth to be written, As I have been told his first or foulest Copys required no great Labour to render them competent for the nicest judgments. A

high perfection, attainable only by use, and treating with every man in his respective profession, and what he was most vers'd in. So as I have heard him entertain a Country Lord in the proper terms relating to Hawks and Dogs. And at another time out-Cant a London Chirurgeon. Thus he did not only learn himself, but gratifie such as taught him; who looked upon their Callings as honoured through his Notice; Nor did an easie falling into Arguments (not unjustly taken for a blemish in the most) appear less than an ornament in Him: The ears of the hearers receiving more gratification, than trouble; And (so) no less sorry when he came to conclude, than displeased with any did interrupt him. Now this general Knowledge he had in all things, husbanded by his wit, and dignifi'd by so Majestical a carriage he was known to own, strook such an awful reverence in those he question'd, that they durst not conceal the most intrinsick part of their Mysteries from him, for fear of appearing Ignorant, or Saucy. All which rendered him no less Necessary, than admirable at the Council Table, where in reference to Impositions, Monopolies, &c. the meanest Manufacturers were an usual Argument: And, as I have heard, did in this Baffle, the Earl of Middlesex, that was born and bred a Citizen &c. Yet without any great (if at all) interrupting his other Studies, as is not hard to be Imagined of a quick Apprehension, in which he was Admirable."

Chapter XXIV. THE MISSING FOURTH PART OF "THE GREAT INSTAURATION."

It has been urged by critics that Bacon, whilst professing to take all knowledge for his province, ignored one-half of it — that half which was a knowledge of himself; that to him the external world was everything, the internal nothing. All that Nature revealed was external; nothing that was internal was of much importance.

It must be remembered that all that we have of Bacon's was written as he was passing into the "vale of life." Of his early productions nothing has come down to the present times under his own name. The following extracts from his acknowledged works establish two facts: — (1) That the foregoing criticism is unfounded, for he placed the study of man's mind and character above all other enquiries. (2) That he had prepared examples, being "actual types and models, by which the entire process of the mind and the whole fabric and order of invention from the beginning to the end in certain subjects and those various and remarkable should be set, as it were, before the eyes." Where are these works to be found?

Bacon never tires of quoting from the Roman poet the line —

"Omne tulit punctum qui miscuit utile dulci,"

which, in an Elizabethan handwriting, may be seen in a contemporary volume thus rendered —

"He of all others fittest is to write
Which with some profit allso ioynes delight."

He repeats in different forms, until the reiteration becomes almost tedious, the following incident: —

“And as Alexander Borgia was wont to say, of the expedition of the French for Naples, that they came with chalk in their hands to marke up their lodgings not with weapons to fight; so we like better, that entry of truth, which comes peaceably where the Mindes of men, capable to lodge so great a guest, are signed, as it were, with chalke; than that which comes with Pugnacity, and forceth itselfe a way by contentions and controversies.”

The same idea is embodied in the following example of the antitheta: —

“A witty conceit is oftentimes a convoy of a Truth which otherwise could not so handsomely have been ferried over.”

In the “Advancement of Learning,” Lib. II., again the same view is insisted on: —

“Besides in all wise humane Government, they that sit at the helme, doe more happily bring their purposes about, and insinuate more easily things fit for the people, by pretexts, and oblique courses; than by downe-right dealing. Nay (which perchance may seem very strange) in things meerely naturall, you may sooner deceive nature, than force her; so improper, and selfe impeaching are open direct proceedings; whereas on the other side, an oblique and an insinuing way, gently glides along and compasseth the intended effect.”

One other fact must be realised before the full import of the quotations about to be made can be appreciated. In the “Distributio Operis” prefixed to the “Novum Organum” the following significant passage occurs[53]: —

“For as often as I have occasion to report anything as deficient, the nature of which is at all obscure, so that men may not perhaps easily understand what I mean or what the work is which I have in my head, I shall always (provided it be a matter of any worth) take care to subjoin either directions for the execution of such work, or else a portion of the work itself executed by myself as a sample of the whole: thus giving assistance in every case either by work or by counsel.”

In the “Advancement of Learning,” Book II., chap. i., it is written:

“That is the truest Partition of humane Learning, which hath reference to the three Faculties of Man’s soule, which is the feat of Learning. History is referred

to Memory, Poesy to the Imagination, Philosophy to Reason. By Poesy, in this place, we understand nothing else, but feigned History, or Fables. As for Verse, that is only a style of expression, and pertaines to the Art of Elocution, of which in due place."

"Poesy, in that sense we have expounded it, is likewise of Individuals, fancied to the similitude of those things which in true History are recorded, yet so as often it exceeds measure; and those things which in Nature would never meet, nor come to passe, Poesy composeth and introduceth at pleasure, even as Painting doth: which indeed is the work of the Imagination."

And in the same book, Chapter XIII.: —

"Drammaticall, or Representative Poesy, which brings the World upon the stage, is of excellent use, if it were not abused. For the Instructions, and Corruptions, of the Stage, may be great; but the corruptions in this kind abound, the Discipline is altogether neglected in our times. For although in moderne Commonwealths, Stage-plaies be but estimed a sport or pastime, unlesse it draw from the Satyre, and be mordant; yet the care of the Ancients was, that it should instruct the minds of men unto virtue. Nay, wise men and great Philosophers, have accounted it, as the Archet, or musicall Bow of the Mind. And certainly it is most true, and as it were, a secret of nature, that the minds of men are more patent to affections, and impressions, Congregate, than solitary."

The third chapter of Book VII. of the "De Augmentis" is devoted to emphasising the importance of a knowledge of the internal working of the mind and of the disposition and character of men. The following extracts are of special moment: —

"Some are naturally formed for contemplation, others for business, others for war, others for advancement of fortune, others for love, others for the arts, others for a varied kind of life; so among the poets (heroic, satiric, tragic, comic) are everywhere interspersed, representations of characters, though generally exaggerated and surpassing the truth. And this argument touching the different characters of dispositions is one of those subjects in which the common

discourse of men (as sometimes, though very rarely, happens) is wiser than books."

The drama as the only vehicle through which this can be accomplished at once suggests itself to the reader. But in order to emphasize this point he proceeds —

"But far the best provision and material for this treatise is to be gained from the wiser sort of historians, not only from the commemorations which they commonly add on recording the deaths of illustrious persons, but much more from the entire body of history as often as such a person enters upon the stage."

Bacon becomes still more explicit. He continues: —

"Wherefore out of these materials (which are surely rich and abundant) let a full and careful treatise be constructed. Not, however, that I would have their characters presented in ethics (as we find them in history, or poetry, or even in common discourse) in the shape of complete individual portraits, but rather the several features and simple lineaments of which they are composed, and by the various combinations and arrangements of which all characters whatever are made up, showing how many, and of what nature these are, and how connected and subordinated one to another; that so we may have a scientific and accurate dissection of minds and characters, and the secret dispositions of particular men may be revealed; and that from a knowledge thereof better rules may be framed for the treatment of the mind. And not only should the characters of dispositions which are impressed by nature be received into this treatise, but those also which are imposed upon the mind by sex, by age, by region, by health and sickness, by beauty and deformity and the like; and again, those which are caused by fortune, as sovereignty, nobility, obscure birth, riches, want, magistracy, privateness, prosperity, adversity and the like."

Shortly after follows this remarkable pronouncement.

"But to speak the truth the poets and writers of history are the best doctors of this knowledge,[54] where we may find painted forth with great life and dissected, how affections are kindled and excited, and how pacified and restrained, and how again contained from act and further degree; how they disclose themselves,

though repressed and concealed; how they work; how they vary; how they are enwrapped one within another; how they fight and encounter one with another; and many more particulars of this kind; amongst which this last is of special use in moral and civil matters; how, I say, to set affection against affection, and to use the aid of one to master another; like hunters and fowlers who use to hunt beast with beast, and catch bird with bird, which otherwise perhaps without their aid man of himself could not so easily contrive; upon which foundation is erected that excellent and general use in civil government of reward and punishment, whereon commonwealths lean; seeing these predominant affections of fear and hope suppress and bridle all the rest. For as in the government of States it is sometimes necessary to bridle one faction with another, so is it in the internal government of the mind."

In his "Distributio Operis" Bacon thus describes the missing fourth part of his "Instauratio Magna": —

"Of these the first is to set forth examples of inquiry and invention[55] according to my method exhibited by anticipation in some particular subjects; choosing such subjects as are at once the most noble in themselves among those under enquiry, and most different one from another, that there may be an example in every kind. I do not speak of these precepts and rules by way of illustration (for of these I have given plenty in the second part of the work); but I mean actual types and models, by which the entire process of the mind and the whole fabric and order of invention from the beginning to the end in certain subjects, and those various and remarkable, should be set as it were before the eyes. For I remember that in the mathematics it is easy to follow the demonstration when you have a machine beside you, whereas, without that help, all appears involved and more subtle than it really is. To examples of this kind — being, in fact, nothing more than an application of the second part in detail and at large — the fourth part of the work is devoted."

The late Mr. Edwin Reed has, in his "Francis Bacon our Shakespeare," page 126, drawn attention to a remarkable circumstance. In 1607 Bacon had written his "Cogitata et Visa," which was the forerunner of his "Novum Organum." It

was not published until twenty-seven years after his death, namely, in 1653, by Isaac Gruter, at Leyden. In 1857 Mr. Spedding found a manuscript copy of the "Cogitata" in the library of Queen's College at Oxford. This manuscript had been corrected in Bacon's own handwriting. It contained passages which were omitted from Gruter's print. Spedding did not realise the importance of the omitted passages, but Mr. Edwin Reed has made this manifest. The following extract is specially noteworthy, the portion printed in italics having been omitted by Gruter: —

"... So he thought best, after long considering the subject and weighing it carefully, first of all to prepare *Tabulæ Inveniendi* or regular forms of inquiry; in other words, a mass of particulars arranged for the understanding, and to serve, as it were, for an example and almost visible representation of the matter. For nothing else can be devised that would place in a clearer light what is true and what is false, or show more plainly that what is presented is more than words, and must be avoided by anyone who either has no confidence in his own scheme or may wish to have his scheme taken for more than it is worth.

"*But when these Tabulæ Inveniendi have been put forth and seen, he does not doubt that the more timid wits will shrink almost in despair from imitating them with similar productions with other materials or on other subjects; and they will take so much delight in the specimen given that they will miss the precepts in it. Still, many persons will be led to inquire into the real meaning and highest use of these writings, and to find the key to their interpretation, and thus more ardently desire, in some degree at least, to acquire the new aspect of nature which such a key will reveal. But he intends, yielding neither to his own personal aspirations nor to the wishes of others, but keeping steadily in view the success of his undertaking, having shared these writings with some, to withhold the rest until the treatise intended for the people shall be published.*"

Now what conclusions may be drawn from the foregoing extracts? Bacon attached the greatest importance to the consideration of the internal life of man. He affirms that dramaticall or representative poesy, which brings the world upon the stage, is of excellent use if it be not abused. The discipline of the stage was

neglected in his time, but the care of the ancients was that it should instruct the minds of men unto virtue, and wise men and great philosophers accounted it as the musical bow of the mind. He has devoted the fourth part of his "Instauratio Magna" to setting forth examples of inquiry and invention, choosing such subjects as are at once the most noble in themselves and the most different one from another, that there may be an example in every kind. He is not speaking of precepts and rules by way of interpretation, but actual types and models by which the entire process of the mind, and the whole fabric and order of invention, should be set, as it were, before the eyes.

Not only should the characters of dispositions which are impressed by nature be received into this treatise, but those also which are imposed upon the mind by sex, by age, by region, by health and sickness, by beauty and deformity, and the like; and, again, those that are caused by fortune, as sovereignty, nobility, obscure birth, riches, want, magistracy, privateness, prosperity, adversity, and the like.

The fourth part of Bacon's "Great Instauration" is missing. The above requirements are met in the Shakespeare plays. Could the dramas be more accurately described than in the foregoing extracts?

From a study of the plays let a list be made out of the qualifications which the author must have possessed. It will be found that the only person in whom every qualification will be found who has lived in any age of any country was Francis Bacon. Any investigator who will devote the time and trouble requisite for an exhaustive examination of the subject can come to no other conclusion.

One cannot without feeling deep regret recognise that we have to turn to a foreigner to give "reasons for the faith which we English have in Shakespeare." It was a German, Schlegel, who discovered the great dramatist, and to-day we must turn to his "Lectures on the Drama" for the most penetrating description of his plays. The following is a translation of a passage which in describing the plays almost adopts the words Bacon uses in the foregoing passages as to the scope and object of the fourth part of his "Great Instauration."

“Never, perhaps, was there so comprehensive a talent for the delineation of character as Shakespeare’s. It not only grasps the diversities of rank, sex, and age, down to the dawnings of infancy; not only do the king and the beggar, the hero and the pickpocket, the sage and the idiot speak and act with equal truth; not only does he transport himself to distant ages and foreign nations, and portray in the most accurate manner, with only a few apparent violations of costume, the spirit of the ancient Romans, of the French in their wars with the English, of the English themselves during a great part of their history, of the Southern Europeans (in the serious part of many comedies), the cultivated society of that time, and the former rude and barbarous state of the North; his human characters have not only such depth and precision that they cannot be arranged under classes, and are inexhaustible, even in conception; no, this Prometheus not merely forms men, he opens the gates of the magical world of spirits, calls up the midnight ghost, exhibits before us his witches amidst their unhallowed mysteries, peoples the air with sportive fairies and sylphs; and these beings, existing only in imagination, possess such truth and consistency that even when deformed monsters like Caliban, he extorts the conviction that if there should be such beings they would so conduct themselves. In a word, as he carries with him the most fruitful and daring fancy into the kingdom of nature; on the other hand, he carries nature into the regions of fancy, lying beyond the confines of reality. We are lost in astonishment at seeing the extraordinary, the wonderful, and the unheard of in such intimate nearness.”

“If Shakespeare deserves our admiration for his characters he is equally deserving of it for his exhibition of passion, taking this word in its widest signification, as including every mental condition, every tone from indifference or familiar mirth to the wildest rage and despair. He gives us the history of minds, he lays open to us in a single word a whole series of preceding conditions. His passions do not at first stand displayed to us in all their height, as is the case with so many tragic poets who, in the language of Lessing, are thorough masters of the legal style of love. He paints, in a most inimitable manner, the gradual progress from the first origin. ‘He gives,’ as Lessing says, ‘a

living picture of all the most minute and secret artifices by which a feeling steals into our souls; of all the imperceptible advantages which it there gains, of all the stratagems by which every other passion is made subservient to it, till it becomes the sole tyrant of our desires and our aversions.' Of all poets, perhaps, he alone has portrayed the mental diseases — melancholy, delirium, lunacy — with such inexpressible, and in every respect definite truth, that the physician may enrich his observations from them in the same manner as from real cases."

Chapter XXV. THE PHILOSOPHY OF BACON.

To attempt anything of the nature of a review of Bacon's acknowledged works is a task far too great for the scope of the present volume. To attempt a survey of the whole of his works would require years of diligent study, and would necessitate a perusal of nearly every book published in England between 1576 and 1630. Not that it is suggested that all the literature of this period was the product of his pen or was produced under his supervision, but each book published should be read and considered with attention to arrive at a selection.

There has been no abler judgment of the acknowledged works than that which will be found in William Hazlitt's "Lectures on the Literature of the Age of Elizabeth." Lecture VII. commences with an account of the "Character of Bacon's Works."

It may not, however, be out of place here to try and make plain in what sense Bacon was a philosopher.

In Chapter CXVI. of the "Novum Organum" he makes his position clear in the following words: —

"First then I must request men not to suppose that after the fashion of ancient Greeks, and of certain moderns, as Telesius, Patricius, Severinus, I wish to found a new sect in philosophy. For this is not what I am about; nor do I think that it matters much to the fortunes of men what abstract notions one may entertain concerning nature and the principles of things; and no doubt many old theories of this kind can be revived, and many new ones introduced; just as many theories of the heavens may be supposed which agree well enough with the phenomena and yet differ with each other.

"For my part, I do not trouble myself with any such speculative and withal unprofitable matters. My purpose on the contrary, is to try whether I cannot in very fact lay more firmly the foundations and extend more widely the limits of the power and greatness of man ... I have no entire or universal theory to propound."

So the idea that there was what is termed a system of philosophy constructed by Bacon must be abandoned. What justification is there for calling him the father of the Inductive Philosophy?

It is difficult to answer this question. Spedding admits that Bacon was not the first to break down the dominion of Aristotle. That followed the awakening throughout the intellectual world which was brought about by the Reformation and the revival of learning. Sir John Herschel justifies the application to Bacon of the term "The great Reformer of Philosophy" not on the ground that he introduced inductive reasoning, but because of his "keen perception and his broad and spirit-stirring, almost enthusiastic announcement of its paramount importance, as the Alpha and Omega of science, as the grand and only chain for linking together of physical truths and the eventual key to every discovery and application."

Bacon was 60 years of age when his "Novum Organum" was published. It was founded on a tract he had written in 1607, which he called "Cogitata et Visa," not printed until long after his death. He had previously published a portion of his Essays, the two books on "The Advancement of Learning" and "The Wisdom of the Ancients." Just at the end of his life he gave to the world the "Novum Organum," accompanied by "The Parasceve." Certainly it was not understood in his time. Coke described it as only fit to freight the Ship of Fools, and the King likened it "to the peace of God which passeth all understanding." It is admittedly incomplete, and Bacon made no attempt in subsequent years to complete it. It is a book that if read and re-read becomes fascinating. Taine describes it as "a string of aphorisms, a collection as it were of scientific decrees as of an oracle who foresees the future and reveals the truth." "It is intuition not reasoning," he adds. The wisdom contained in its pages is profound. An understanding of the interpretation of the Idols and the Instances has so far evaded all commentators. Who can explain the "Latent Process"? But the book contains no scheme of arrangement. Therein is found a series of desultory discourses — full of wisdom, rich in analogies, abundant in observation and

profound in comprehension. From here and there in it with the help of the "Parasceve" one can grasp the intention of the great philosopher.

In Chapter LXI. he says:— "But the course I propose for the discovery of sciences is such as leaves but little to the acuteness and strength of wits, but places all wits and understandings on a level." How was this to be accomplished? By the systemization of labour expended on scientific research. A catalogue of the particulars of histories which were to be prepared is appended to the "Parasceve." It embraces every subject conceivable. In Chapter CXI. he says, "I plainly confess that a collection of history, natural and experimental, such as I conceive it, and as it ought to be, is a great, I may say a royal work, and of much labour and expense."

In the "Parasceve" he says:— "If all the wits of all the ages had met or shall hereafter meet together; if the whole human race had applied or shall hereafter apply themselves to philosophy, and the whole earth had been or shall be nothing but academies and colleges and schools of learned men; still without a natural and experimental history such as I am going to prescribe, no progress worthy of the human race could have been made or can be made in philosophy and the sciences. Whereas on the other hand let such a history be once provided and well set forth and let there be added to it such auxiliary and light-giving experiments as in the very course of interpretation will present themselves or will have to be found out; and the investigation of nature and of all sciences will be the work of a few years. This therefore must be done or the business given up."

To carry out this work an army of workers was required. In the preparation of each history some were to make a rough and general collection of facts. Their work was to be handed over to others who would arrange the facts in order for reference. This accomplished, others would examine to get rid of superfluities. Then would be brought in those who would re-arrange that which was left and the history would be completed.

From Chapter CIII. it is clear that Bacon contemplated that eventually all the experiments of all the arts, collected and digested, *should be brought within one*

man's knowledge and judgment. This man, having a supreme view of the whole range of subjects, would transfer experiments of one art to another and so lead "to the discovery of many new things of service to the life and state of man."

Nearly three hundred years have passed since Bacon propounded his scheme. The arts and sciences have been greatly advanced. They might have proceeded more rapidly had the histories been prepared, but since his time there has arisen no man who has taken "all knowledge to be his province" — no man who could occupy the position Bacon contemplated.

The method by which the induction was to be followed is described in Chapter CV. There must be an analysis of nature by proper rejections and exclusions, and then, after a sufficient number of negatives, a conclusion should be arrived at from the affirmative instances. "It is in this induction," Bacon adds, "that our chief hope lies."

Bacon's new organ has never been constructed, and all wits and understandings have not yet been placed on a level.

We come back to the mystery of Francis Bacon, the possessor of the most exquisite intellect that was ever bestowed on any of the children of men. As an historian, he gives us a taste of his quality in "Henry VII." In the Essays and the "Novum Organum," sayings which have the effect of axioms are at once striking and self-evident. But he is always desultory. In perceiving analogies between things which have nothing in common he never had an equal, and this characteristic, to quote Macaulay, "occasionally obtained the mastery over all his other faculties and led him into absurdities into which no dull man could have fallen." His memory was so stored with materials, and these so diverse, that in similitude or with comparison he passed from subject to subject. In the "Advancement of Learning" are enumerated the deficiencies which Bacon observed, *nearly the whole of which were supplied during his lifetime*.

The "Sylva Sylvarum" is the most extraordinary jumble of facts and observations that has ever been brought together. It is a literary curiosity. The "New Atlantis" and other short works in quantity amount to very little. Bacon's life has hitherto remained unaccounted for. In the foregoing pages an attempt has

been made to offer an intelligible explanation of the work to which he devoted his life, namely, to supply the deficiencies which he had himself pointed out and which retarded the advancement of learning.

Hallam has said of Bacon: “If we compare what may be found in the sixth, seventh, and eighth books of the ‘De Augmentis,’ and the various short treatises contained in his works on moral and political wisdom and on human nature, with the rhetoric, ethics, and politics of Aristotle, or with the historians most celebrated for their deep insight into civil society and human character — with Thucydides, Tacitus, Phillipe de Comines, Machiavel, David Hume — we shall, I think, find that one man may almost be compared with all of these together.”

Pope wrote: “Lord Bacon was the greatest genius that England, or perhaps any other country, ever produced.” If an examination, more thorough than has hitherto been made, of the records and literature of his age establishes beyond doubt the truth of the suggestions which have now been put forward, what more can be said? This at any rate, that to him shall be given that title to which he aspired and for which he was willing to renounce his own name. He shall be called “The Benefactor of Mankind.”

APPENDIX.

Sir Thomas Bodley left behind him a short history of his life which is of a fragmentary description. One-fourth of it is devoted to a record of how much he suffered in permitting Essex to urge his advancement in the State. The following is the passage: —

"Now here I can not choose but in making report of the principall accidents that have fallen unto me in the course of my life, but record among the rest, that from the very first day I had no man more to friend among the Lords of the Councell, than was the Lord Treasurer Burleigh: for when occasion had beene offered of declaring his conceit as touching my service, he would alwaies tell the Queen (which I received from her selfe and some other ear-witnesses) that there was not any man in *England* so meet as myselfe to undergoe the office of the Secretary. And sithence his sonne, the present Lord Treasurer, hath signified unto me in private conference, that when his father first intended to advance him to that place, his purpose was withall to make me his Colleague. But the case stood thus in my behalf: before such time as I returned from the Provinces united, which was in the yeare 1597, and likewise after my returne, the then Earle of *Essex* did use me so kindly both by letters and messages, and other great tokens of his inward favours to me, that although I had no meaning, but to settle in my mind my chiefest desire and dependance upon the Lord *Burleigh*, as one that I reputed to be both the best able, and therewithall the most willing to worke my advancement with the Queene, yet I know not how, the Earle, who fought by all devices to divert her love and liking both from the Father and the Son (but from the Sonne in speciall) to withdraw my affection from the one and the other, and to winne mee altogether to depend upon himselfe, did so often take occasion to entertaine the Queene with some prodigall speeches of my sufficiency for a Secretary, which were ever accompanied with words of disgrace against the present Lord Treasurer, as neither she her selfe, of whose favour before I was thoroughly assured, took any great pleasure to preferre me the sooner, (for she

hated his ambition, and would give little countenance to any of his followers) and both the Lord *Burleigh* and his Sonne waxed jealous of my courses, as if under hand I had beene induced by the cunning and kindnesse of the Earle of *Essex*, to oppose my selfe against their dealings. And though in very truth they had no solid ground at all of the least alteration in my disposition towards either of them both, (for I did greatly respect their persons and places, with a settled resolution to doe them any service, as also in my heart I detested to be held of any faction whatsoever) yet the now Lord Treasurer, upon occasion of some talke, that I have since had with him, of the Earle and his actions, hath freely confessed of his owne accord unto me, that his daily provocations were so bitter and sharpe against him, and his comparisons so odious, when he put us in a ballance, as he thought thereupon he had very great reason to use his best meanes, to put any man out of hope of raising his fortune, whom the Earle with such violence, to his extreame prejudice, had endeavoured to dignifie. And this, as he affirmed, was all the motive he had to set himselfe against me, in whatsoever might redound to the bettering of my estate, or increasing of my credit and countenance with the Queene. When I hae thoroughly now bethought me, first in the Earle, of the slender hold-fast that he had in the favour of the Queene, of an endlesse opposition of the cheifest of our Statesmen like still to waite upon him, of his perillous, and feeble, and uncertain advice, as well in his owne, as in all the causes of his friends: and when moreover for my selfe I had fully considered how very untowardly these two Counsellours were affected unto me, (upon whom before in cogitation I had framed all the fabrique of my future prosperity) how ill it did concurre with my naturall disposition, to become, or to be counted either a stickler or partaker in any publique faction, how well I was able, by God's good blessing, to live of my selfe, if I could be content with a competent livelyhood; how short time of further life I was then to expect by the common course of nature: when I had, I say, in this manner represented to my thoughts my particular estate, together with the Earles, I resolved thereupon to possesse my soule in peace all the residue of my daies, to take my full farewell of State imployments, to satisfie my mind with that

mediocrity of worldly living that I had of my owne, and so to retire me from the Court, which was the epilogue and end of all my actions and endeavours of any important note, till I came to the age of fifty-three."

The experience of Bodley and Bacon appears to have been identical. It certainly materially strengthens the case of those who contend that Bacon's conduct to Essex was not deserving of censure on the ground of ingratitude for favours received from him.

The words which Robert Cecil addressed to Bodley, namely, that "he had very great reason to use his best meanes, to put any man out of hope of raising his fortune whom the Earle with such violence, to his extreame prejudice had endeavoured to dignifie," would with equal force have been applied to Bacon's case. The drift of Bodley's account of the matter points to his feeling that Essex's conduct had not been of a disinterested character, and suggests that he felt the Earle had been making a tool of him.

The effect of this was that Bodley adopted the course which Bacon threatened to adopt when refused the office of Attorney-General, solicited for him by Essex — he took a farewell of State employments and retired from the Court to devote himself to the service of his "Reverend Mother, the University of Oxford," and to the advancement of her good. To this end he became a collector of books, whereas Bacon would have become "some sorry book-maker or a true pioner in that mine of truth which Anaxagoras said lay so deep."

ENDNOTES.

[1] Attention is drawn to one of the inaccuracies in "An Introduction to Mathematics," by A. W. Whithead, Sc.D., F.R.S., published in the Home University Library of Modern Knowledge. The author says: "Macaulay in his essay on Bacon contrasts the certainty of mathematics with the uncertainty of philosophy, and by way of a rhetorical example he says, 'There has been no re-action against Taylor's theorem.' He could not have chosen a worse example. For, without having made an examination of English text-books on mathematics contemporary with the publication of this essay, the assumption is a fairly safe one that Taylor's theorem was enunciated and proved wrongly in every one of them."

[2] There are copies of this work bearing date 1626, the year in which Bacon died.

[3] The concluding paragraph of the Epistle to the Reader is as follows: "It's easily imaginable how unconcerned I am as to the fate of this Book either in the History, or the Observations, since I have been so faithful in the first, that it is not my own, but the Historians; and so careful in the second that they are not mine, but the Histories."

[4] "Life and Letters," Vol. VII., page 552.

[5] Lloyd states that this occurred when he was seven years of age.

[6] "The Lives of Statesmen and Favourites of Elizabeth."

[7] Dr. Whitgift was a man of strong moral rectitude, yet in 1593 he became one of its sponsors on the publication of "Venus and Adonis."

[8] It was to Sir Amias that the custody of Mary Queen of Scots was committed.

[9] In the "Gesta Grayorum" one of the articles which the Knights of the Helmet were required to vow to keep, each kissing his helmet as he took his vow, was "Item — every Knight of this Order shall endeavour to add conference and experiment to reading; and therefore shall not only read and peruse 'Guizo,' 'The French Academy,' 'Galiatto the Courtier,' 'Plutarch,' 'The Arcadia,' and the Neoterical writers from time to time," *etc.* The "Gesta Grayorum," which was written in 1594, was not published until 1687. The manuscript was probably incorrectly read as to the titles of the books. "Galiatto," apparently, should be "Galateo," described in a letter of Gabriel Harvey as "The Italian Archbishop brave Galateo." The "Courtier" is the Italian work by Castiglione which was Englished by Sir Thomas Hoby. "Guizo" should be "Guazzo." Stefano Guazzo's "Civil Conversation" — four books — was Englished by G. Pettie and Young.

[10] "Hit" is used by Chaucer as the past participle of "Hide." The name thus yields a suggestive anagram, "Bacohit."

[11] 1618 Edition, page 712.

[12] In addition to this and to the "Gesta Grayorum" (1692) I have only been able to find two references to "The French Academy" in the works of English writers.

J. Payne Collier, in his "Poetical Decameron," Vol. II., page 271, draws attention to the epistle "to the Christian reader" prefixed to the second part, and suggests that the initials T.B. which occur at the end of the dedicatory epistle stand for Thomas Beard, the author of "Theatre of God's Judgments." Collier does not appear to have read "The French Academy." Dibdin, in "Notes on More's Utopia," says, "But I entreat the reader to examine (if he be fortunate enough to possess the book) "The French Academy of Primaudaye," a work written in a style of peculiarly impressive eloquence, and which, not very improbably, was the foundation of Derham's and Paley's "Natural Theology."

[13] "It being now forty years as I remember, since I composed a juvenile work on this subject which with great confidence and a magnificent title I named "The greatest birth of Time."

[14] The block was used on page 626 of the 1594 quarto edition of William Camden's "Britannia," published in London by George Bishop, who was the publisher of the 1586, 1589, and 1594 editions of "The French Academy." There is a marginal note at the foot of the imprint of the block commencing "R. Bacons." Francis Bacon is known to have assisted Camden in the preparation of this work. The manuscript bears evidence of the fact in his handwriting.

[15] One copy of this edition bears the date 1628.

[16] Probably Owen Fellthам, author of "Fellthам's Resolves."

[17] Sir Thomas Smith (1512-1577) was Secretary of State under Edward VI. and Elizabeth — a good scholar and philosopher. He, when Greek lecturer and orator at Cambridge, with John Cheke, introduced, in spite of strong opposition, the correct way of speaking Greek, restoring the pronunciation of the ancients.

[18] State Paper Office; French Correspondence.

[19] Spedding prints this in small type, being doubtful as to the authorship.

[20] That is, never held a brief.

[21] I am indebted to Mr. Harold Hardy for this interesting information. There is an entry in the State Papers, 1608, Jan. 31: Grant at the suit of Sir Francis Bacon to Sir William Cooke, Sir John Constable, and three others, of the King's reversion of the estates in Herts above referred to. Sir Nicholas, to whom it had descended from the Lord Keeper, conveyed the remainder to Queen Elizabeth her heirs and successors "with the condition that if he paid £100 the grant should be void, which was apparently done to prevent the said Sir Francis to dispose of the same land which otherwise by law he might have done." When Lady Anne conveyed the Markes estate to Francis it was subject to a similar condition, namely, that the grant was to be null and void on Lady Ann paying ten shillings to Francis. This condition made it impossible for Francis to dispose of his interest in the estate, hence Anthony's request in the letter above referred to. It is obvious that his relatives considered that Francis was not to be trusted with property which he could turn into money. There was evidently some heavy strain on his resources which caused him to convert everything he could into cash.

[22] "Story of Lord Bacon's Life." Hepworth Dixon, p. 28.

[23] The two letters of 16th September, 1580, and that of 15th October, 1580, are taken from copies in the Lansdowne collection. That of the 6th May, 1586, is in the same collection, and is an original in Bacon's handwriting. The letter of 25th August, 1585, is also in his handwriting, and is in the State Papers, Domestic. The letter without date, written to Burghley presumably in 1591, is from the supplement to the "Resuscitatio," 1657.

[35] 33 is the numerical value of the name "Bacon." The stop preceding it denotes cypher.

[36] Vautrollier was a scholar and printer who came to England from Paris or Roan about the beginning of Elizabeth's reign, and first commenced business in Blackfriars. In 1584 he printed *Jordanus Brunus*, for which he was compelled to fly. In the next year he was in Edinburgh, where, by his help, Scottish printing was greatly improved. Eventually his pardon was procured by powerful friends, amongst whom was Thomas Randolph. In 1588 Richard Field, who was apprenticed to Vautrollier, married Jakin, his daughter, and on his death in 1589 succeeded to the business.

[39]

If you, O Mildred, will take care to send back to me him whom I desire,
You will be my good, my more than good, my only sister;
But if, unfortunately, by doing nothing you keep him back and send him across the sea,
You will be bad, more than bad, nay no sister at all of mine.
If he comes to Cornwall, peace and all joys be with you,
But if he goes by sea to Sicily I declare war. Farewell.

[40] One note on this book contains an interesting historical fact hitherto unknown. On page 279 the text states: “Among the Conspirators was Nicholo Fedini whom they employed as Chauncellor, he persuaded with a hope more certaine, revealed to Piero, all the practice argreed by his enemies, and delivered him a note of all their names.” Bacon has made the following note in the margin: “Ex (*i.e.*, Essex) did the like in England which he burnt at Shirfr Smiths house in fenchurch Street.”

Brief Biography: Francis Bacon by Robert Adamson

From '1911 Encyclopædia Britannica, Volume 3'

FRANCIS BACON (Baron Verulam, Viscount St Albans) (1561-1626), English philosopher, statesman and essayist, was born at York House in the Strand, London, on the 22nd of January 1560/1. He was the youngest son of Sir Nicholas Bacon (*q.v.*). His mother, the second wife of Sir Nicholas, was a daughter of Sir Anthony Cooke, formerly tutor to Edward VI. She was a woman of considerable culture, well skilled in the classical studies of the period, and a warm adherent of the Reformed or Puritan Church. Very little is known of Bacon's early life and education. His health being then, as always, extremely delicate, he probably received much of his instruction at home. In April 1573 he was entered at Trinity College, Cambridge, where for three years he resided with his brother Anthony. At Cambridge he applied himself diligently to the several sciences as then taught, and came to the conclusion that the methods employed and the results attained were alike erroneous. Although he preserved a reverence for Aristotle (of whom, however, he seems to have known but little), he learned to despise the current Aristotelian philosophy. It yielded no fruit, was serviceable only for disputation, and the end it proposed to itself was a mistaken one. Philosophy must be taught its true purpose, and for this purpose a new method must be devised. With the first germs of this great conception in his mind, Bacon left the university.

On the 27th of June 1576 he and his brother Anthony were entered *de societate magistrorum* at Gray's Inn, and a few months later he was sent abroad with Sir Amyas Paulet, the English ambassador at Paris. The disturbed state of government and society in France at that time afforded him valuable political instruction. It was formerly supposed that certain *Notes on the State of Christendom*, usually printed in his works, contain the results of his

observations, but Spedding has shown that there is no reason for ascribing these *Notes* to him, and that they may be attributed with more probability to one of his brother Anthony's correspondents.

The sudden death of his father in February 1578/9 necessitated Bacon's return to England, and exercised a very serious influence on his fortunes. A considerable sum of money had been laid up by Sir Nicholas for the purchase of an estate for his youngest son, the only one otherwise unprovided for. Owing to his sudden death, this intention was not carried out, and a fifth only of the money descended to Francis. This was one of the gravest misfortunes of his life; he started with insufficient means, acquired a habit of borrowing and was never afterwards out of debt. As it had become necessary that he should adopt some profession, he selected that of law, and took up his residence at Gray's Inn in 1579.

In the fragment *De Interpretatione Naturae Prooemium* (written probably about 1603) Bacon analyses his own mental character and lays before us the objects he had in view when he entered on public life. If his opening sentence, "Ego cum me ad utilitates humanas natum existimarem" ("since I thought myself born to be of advantage to mankind"), seems at first sight a little arrogant, it must be remembered that it is the arrogance of Aristotle's μεγαλόψυχος, who thinks himself worthy of great things, and *is* worthy. The ideal of production of good to the human race through the discovery of truth, was combined in him with the practical desire to be of service to his country. He purposed, therefore, to obtain, if possible, some honourable post in the state which would give him the means of realizing these projects, and would enable him to do somewhat for the church, the third of the objects whose good he had at heart. The constant striving after these three ends is the key to Bacon's life. His qualifications for accomplishing the task were not small. His intellect was far-seeing and acute, quick and yet cautious, meditative, methodical and free from prejudice. If we add to this account that he seems to have been of an unusually amiable disposition we have a fairly complete picture of his mental character at this critical period of his life.

In 1580 he appears to have taken the first step in his career by applying, through his uncle, Burghley, the lord treasurer, for some post at court. His suit, though well received by the queen, was unsuccessful; the particulars are totally unknown. For two years after this disappointment he worked quietly at Gray's Inn, and in 1582 was admitted an outer barrister. In 1584 he took his seat in parliament for Melcombe in Dorsetshire, but the notes for the session do not disclose what reputation he gained. About the same time he made another application to Burghley, apparently with a view to expediting his progress at the bar. His uncle, who appears to have "taken his zeal for ambition," wrote him a severe letter, taking him to task for arrogance and pride, qualities which Bacon vehemently disclaimed. As his advancement at the bar was unusually rapid, his uncle's influence may have been exerted in his behalf. In 1589 he received the first substantial piece of patronage from his powerful kinsman, the reversion of the clerkship of the Star Chamber. The office was worth about £1600 a year; but it did not become vacant for nearly twenty years. A considerable period of his life thus slipped away, and his affairs had not prospered. He had written on the condition of parties in the church; he had set down his thoughts on philosophical reform in the lost tract, *Temporis Partus Maximus*; but he had failed in obtaining the position which he looked upon as an indispensable condition of success. A long and eloquent letter to Burghley throws additional light upon his character, and gives a hint as to the cause of his uncle's slackness in promoting him.

Some time before this, perhaps as early as 1588, Bacon appears to have become acquainted with the earl of Essex, Elizabeth's favourite. At the close of 1591 he was acting as the earl's confidential adviser, and exerted himself, together with his brother Anthony, diligently in the earl's service. In February 1593 parliament was called, and Bacon took his seat for Middlesex. The special occasion for which the House had been summoned was the discovery of one of the numerous popish plots that distracted Elizabeth's reign.

As Bacon's conduct in this emergency seriously affected his fortunes and has been much misunderstood, it is necessary to state, as briefly as possible, the whole facts of the case. The House having been duly informed of the state

necessities, assented to a double subsidy and appointed a committee to draw up the requisite articles. Before this was completed, a message arrived from the House of Lords requesting a conference, which was granted. The committee of the Commons were then informed that the crisis demanded a triple subsidy to be collected in a shorter time than usual, that the Lords could not assent to less than this, and that they desired to confer on the matter. This proposal of the Lords to discuss supply infringed upon the privileges of the Commons; accordingly, when the report of committee was read to the Lower House, Bacon spoke against the proposed conference, pointing out at the same time that a communication from the Lords might be received, but that the actual deliberation on it must be taken by themselves alone. His motion, after some delay, was carried and the conference was rejected. The Lords upon this lowered their demands, and desired merely to make a communication, which, being legitimate, was at once assented to. The House had then before them the proposal for a triple subsidy, to be collected in three, or, as the motion ultimately was shaped, in four years, instead of in six, as the ordinary custom would have been. Bacon, who approved of the increased subsidy, was opposed to the short period in which it was proposed to raise it. He suggested that it would be difficult or impossible for the people to meet such heavy demands, that discontent and trouble would arise, and that the better method of procedure was to raise money by levy or imposition. His motion appears to have received no support, and the four years' subsidy was passed unanimously. Bacon, as it turned out, had been mistaken in thinking that the country would be unable to meet the increased taxation, and his conduct, though prompted by a pure desire to be of service to the queen, gave deep and well-nigh ineradicable offence. He was accused of seeking popularity, and was for a time excluded from the court. His letter to Burghley, who had told him of the queen's displeasure with his speech, offers no apology for what he had said, but expresses regret that his motives should have been misunderstood. He soon felt that the queen's anger was not to be appeased by such a justification. The attorney-generalship had fallen vacant and Bacon became a candidate for the office, his most formidable rival being his life-long antagonist, Edward Coke,

who was then solicitor. Essex warmly espoused Bacon's cause and earnestly pressed his claims upon the queen; but his impetuous, pettish pleading tended to retard the cause. Burghley, on the other hand, in no way promoted his nephew's interest; he would recommend him for the solicitorship, but not for the attorney-generalship; and it is not improbable that Sir Robert Cecil secretly used his influence against his cousin. The queen delayed the appointment, and Bacon's fortunes, as they then stood, could ill brook delay. He was harassed with debt and at times so disheartened that he contemplated retirement from public life. In March 1594 it was at last understood that Coke was to be attorney-general. Essex, though bitterly mortified, at once threw all his energies into the endeavour to procure for Bacon the solicitorship; but in this case also, his method of dealing, which was wholly opposed to Bacon's advice, seemed to irritate the queen. The old offence was not yet forgiven, and after a tedious delay, the office was given, in October 1595, to Serjeant Thomas Fleming. Burghley and Sir John Puckering seem to have assisted Bacon honestly, if not over-warmly, in this second application; but the conduct of Cecil had roused suspicions which were not perhaps without foundation. Essex, to compensate in some degree for Bacon's disappointment, insisted on presenting him with a piece of land, worth about £1800, and situated probably near Twickenham Park. Nor did his kindness cease there; before sailing on the expedition to Cadiz, in the beginning of 1596, he addressed letters to Buckhurst, Fortescue and Egerton, earnestly requesting them to use their influence towards procuring for Bacon the vacant office of master of the rolls. Before anything came of this application, the Cadiz expedition had resulted in a brilliant success, and Essex became the idol of the army and the people. Bacon saw clearly that such a reputation would assuredly alienate the affections of the queen, who loved not to have a subject too powerful or too popular. He therefore addressed an eloquent and imploring letter to the earl, pointing out the dangers of his position and urging upon him what he judged to be the only safe course of action, to seek and secure the favour of the queen alone; above all things dissuading him from the appearance of military popularity. His advice, however, was unpalatable and proved

ineffectual. The earl still continued his usual course of dealing with the queen, depending solely upon her supposed affection for him, and insanely jealous of any other whom she might seem to favour. His unskilful and unlucky management of the sea expedition to Ferrol and the Azores in no way lowered his popularity with the people, but undoubtedly weakened his influence with the queen.

Bacon's affairs in the meantime had not been prospering. He had increased his reputation by the publication in 1597 of his *Essays*, along with which were the *Colours of Good and Evil* and the *Meditationes Sacrae*; but his private fortunes were in a bad condition. No public office apparently could be found for him; a scheme for retrieving his position by a marriage with the wealthy widow, Lady Elizabeth Hatton, failed, and in 1598 he was arrested for debt. He seems, however, to have been growing in favour with the queen. Some years previously (perhaps about 1594), he had begun to be employed by her in crown affairs, and he gradually acquired the standing of one of the learned counsel, though he had no commission or warrant, and received no salary. At the same time he was no longer on the former friendly terms with Essex, a certain estrangement having sprung up between them, caused no doubt by the earl's dislike of his friend's advice. The earl's affairs were then at a somewhat critical stage, and as our judgment upon a most important episode in Bacon's life depends upon our knowledge of the events of the ensuing year, it will be requisite to enter somewhat minutely into proceedings with which Bacon himself had nothing to do.

Ireland was then in a rebellious and discontented condition, and it was difficult for the English government to decide either on a definite course of policy with regard to it, or on a leader by whom that policy might be carried out. A violent quarrel took place between the queen and Essex, who for some months retired from court and refused to be reconciled. At last he came forth from his seclusion, and it was soon understood that he was in person to undertake the subjugation of the rebels in Ireland, with a larger force than had ever before been sent into that country. Into the obscure details of this unhappy campaign it is

unnecessary to enter; one fact stands out clearly, that Essex endeavoured to carry out a treasonable design. His jealousy and ill-temper had been so roused that the only course open to him seemed to be the obtaining a powerful military force, the possession of which would compel the queen to reinstate him in her favour. Whether or not this plan was in contemplation before he undertook the Irish expedition is not evident, though even outsiders at that time entertained some suspicions, but there can be no doubt of the treasonable character of the negotiations carried on in Ireland. His plans, probably not very definite, were disturbed by an imperative message from the queen, ordering him not to return to England without her permission. He at once set off, and, trusting apparently to her affection for him, presented himself suddenly before her. He was, for the moment, received kindly, but was soon afterwards ordered to keep his chamber, and was then given into the custody of the lord keeper at York House, where he remained till March 1600. His great popularity, and the general ignorance of the reasons for his imprisonment, stirred up a strong feeling against the queen, who was reported to be influenced by Bacon, and such indignation was raised against the latter that his friends feared his life would be in danger. It was at last felt necessary that the queen should in some way vindicate her proceedings, and this she at first did, contrary to Bacon's advice, by a declaration from the Star Chamber. This, however, gave little or no satisfaction, and it was found expedient to do what Bacon had always recommended, to have a fair trial, yet not one in which the sentence must needs be damaging to the earl. The trial accordingly took place before a body of her majesty's councillors, and Bacon had a subordinate and unimportant part in the accusation. Essex does not seem to have been at all hurt by his action in this matter, and shortly after his release they were again on friendly terms, Bacon drawing up letters as if to or from the earl with the design of having them brought before the queen. But Bacon did not know the true character of the transactions in which Essex had been engaged. The latter had been released from all custody in August, but in the meantime he had been busily engaged in treasonable correspondence with James of Scotland, and was counting on the Irish army under his ally, Charles Blount, Baron

Mountjoy (afterwards earl of Devonshire), the new deputy. But Mountjoy had apparently come to see how useless the attempt would be to force upon the queen a settlement of the succession and declined to go farther in the matter. Essex was thus thrown upon his own resources, and his anger against the queen being roused afresh by the refusal to renew his monopoly of sweet wines, he formed the desperate project of seizing her person and compelling her to dismiss from her council his enemies Raleigh, Cobham, and Cecil. As some pretext, he intended to affirm that his life was in danger from these men, who were in league with the Spaniards. The plot was forced on prematurely by the suspicions excited at court, and the rash attempt to rouse the city of London (8th of February 1601), proved a complete *fiasco*. The leaders were arrested that night and thrown into prison. Although the actual rising might have appeared a mere outburst of frantic passion, the private examinations of the most prominent conspirators disclosed to the government a plot so widely spread, and involving so many of the highest in the land, that it would have been perilous to have pressed home accusations against all who might be implicated. Essex was tried along with the young earl of Southampton, and Bacon, as one of her majesty's counsel, was present on the occasion. Coke, who was principal spokesman, managed the case with great want of skill, incessantly allowing the thread of the evidence to escape, and giving the prisoners opportunity to indulge in irrelevant justifications and protestations which were not ineffectual in distracting attention from the real question at issue. On the first opportunity Bacon rose and briefly pointed out that the earl's plea of having done nothing save what was absolutely necessary to defend his life from the machinations of his enemies was weak and worthless, inasmuch as these enemies were purely imaginary; and he compared his case to that of Peisistratus, who had made use of a somewhat similar stratagem to cloak his real designs upon the city of Athens. He was thereupon interrupted by the earl, who proceeded to defend himself, by declaring that in one of the letters drawn up by Bacon, and purporting to be from the earl to Anthony Bacon, the existence of these rumours, and the dangers to be apprehended from them, had been admitted; and he continued, "If these reasons

were then just and true, not counterfeit, how can it be that now my pretences are false and injurious?" To this Bacon replied, that "the letters, if they were there, would not blush to be seen for anything contained in them, and that he had spent more time in vain in studying how to make the earl a good servant to the queen than he had done in any thing else." It seems to be forgotten in the general accounts of this matter, not only that Bacon's letters bear out what he said, but that the earl's excuses *were* false. A second time Bacon was compelled to interfere in the course of the trial, and to recall to the minds of those present the real question at issue. He animadverted strongly upon the puerile nature of the defence, and in answer to a remark by Essex, that if he had wished to stir up a rebellion he would have had a larger company with him, pointed out that his dependence was upon the people of London, and compared his attempt to that of the duke of Guise at Paris. To this the earl made little or no reply. Bacon's use of this illustration and of the former one of Peisistratus, has been much commented on, and in general it seems to have been thought that had it not been for his speeches Essex might have escaped, or, at all events, have been afterwards pardoned. But this view of the matter depends on the supposition that Essex was guilty only of a rash outbreak. That this was not the case was well known to the queen and her council. Unfortunately, prudential motives hindered the publication of the whole evidence; the people, consequently, were still ignorant of the magnitude of the crime, and, till recently, biographers of Bacon have been in a like ignorance. The earl himself, before execution, confessed his guilt and the thorough justice of his sentence, while, with singular lack of magnanimity, he incriminated several against whom accusations had not been brought, among others his sister Lady Rich. After his execution it was thought necessary that some account of the facts should be drawn up and circulated, in order to remove the prejudice against the queen's action in the matter. This was entrusted to Bacon, who drew up a *Declaration of the Practices and Treasons attempted and committed by Robert, late Earl of Essex*, his first draft being extensively altered and corrected by the queen and council. Nothing is known with certainty of the reception given to this official explanation, but the ill-feeling against Bacon was

not wholly removed, and some years later, in 1604, he published, in the form of a letter to Mountjoy, an *Apology* for his action in the case. This *Apology* gives a most fair and temperate history of the relations between Bacon and Essex, shows how the prudent counsel of the one had been rejected by the other, and brings out very clearly what we conceive to be the true explanation of the matter. Everything that Bacon could do was done by him, until the real nature of Essex's design was made apparent, and then, as he had repeatedly told the earl, his devotion and respect were for the queen and state, not for any subject; friendship could never take rank above loyalty. Those who blame Bacon must acquit Essex of all wrong-doing.

Bacon's private fortunes, during the period after the death of Essex, were not in a flourishing condition. He had obtained a grant of £1200 from the fines imposed on Catesby, one of the conspirators, but his debts were sufficient to swallow up this and much more. And, though he was trusted by Elizabeth, and on good terms with her, he seems to have seen that he had no chance of advancement. But her death in 1603, followed by the undisputed succession of James, gave him new hopes. He used every means in his power to bring himself under James's notice, writing to all his friends at the Scottish court and to the king himself. He managed to obtain a personal interview with the king, but does not seem to have been much satisfied with it. In fact, while the king confirmed in their situations those who had held crown offices under Elizabeth, Bacon, not holding his post by warrant, was practically omitted. He was, however, continued, by special order of the king, as learned counsel extraordinary, but little or no law business appears to have been entrusted to him. He procured, through his cousin Cecil, the dignity of knighthood, which, contrary to his inclination, he received along with about 300 others, on the 23rd of July 1603. Between this time and the opening of James's first parliament he was engaged in literary work, and sent to the king two pamphlets — one on the Union, the other on measures for the pacification of the church. Shortly after he published his *Apology*. In March 1604 parliament met, and during their short session Bacon's hands seem to have been full of work. It was a busy and stirring time, and events

occurred during it which carried within them the seeds of much future dissension. Prerogative and privilege came more than once into collision, the abuses of purveyance and wardship were made matters of conference, though the thorough discussion of them was deferred to a succeeding session; while James's temper was irritated by the objections brought against his favourite scheme of the Union, and by the attitude taken up by the House with regard to religious affairs. The records are barely full enough to enable us to judge of the share taken by Bacon in these discussions; his name generally appears as the reporter of the committees on special subjects. We can occasionally, however, discern traces of his tact and remarkable prudence; and, on the whole, his attitude, particularly with regard to the Union question, recommended him to James. He was shortly afterwards formally installed as learned counsel, receiving the salary of £40, and at the same time a pension of £60 yearly. He was also appointed one of the commission to treat of the conditions necessary for the Union; and the admirable manner in which the duties of that body were discharged must be attributed mainly to his influence and his complete mastery of the subject. During the recess he published his *Advancement of Learning*, dedicated to the king.

He was now brought into relations with James, and his prospects began to improve. It is important for us to know what were his ideas upon government, upon parliaments, prerogative, and so forth, since a knowledge of this will clear up much that would seem inexplicable in his life. It seems quite evident that Bacon, from position, early training and, one might almost think, natural inclination, held as his ideal of government the Elizabethan system. The king was the supreme power, the centre of law and justice, and his prerogative must not be infringed. Parliament was merely a body called to consult with the king on emergencies (*circa ardua regni*) and to grant supplies. King and parliament together make up the state, but the former is first in nature and importance. The duty of a statesman was, therefore, to carry out the royal will in as prudent a manner as possible; he was the servant of the king, and stood or fell according to his pleasure. He was not singular in his opinions and he was undoubtedly

sincere; and it is only by keeping them constantly in mind that we can understand his after relations with the king.

In the second parliament there was not so much scope for the exercise of his powers. The Gunpowder Plot had aroused in the Commons warmer feelings towards the king; they passed severe laws against recusants, and granted a triple subsidy. At the same time they continued the collection of the grievances concerning which they were to move. In the course of this session Bacon married Alice Barnham "the alderman's daughter, an handsome maiden, to my liking," of whom he had written some years before to his cousin Cecil. Little or nothing is known of their married life.

The third parliament was chiefly occupied with the commercial and legal questions rising out of the proposed Union, in particular, with the dispute as to the naturalization of the *Post Nati*. Bacon argued ably in favour of this measure, but the general feeling was against it. The House would only pass a bill abolishing hostile laws between the kingdoms; but the case of the *Post Nati*, being brought before the law courts, was settled as the king wished. Bacon's services were rewarded in June 1607 by the office of solicitor. Several years passed before he gained another step. Meantime, though circumstances had thrown him too much into active life, he had not forgotten his cherished project of reorganizing natural science. A survey of the ground had been made in the *Advancement*, and some short pieces not published at the time were probably written in the subsequent two or three years. Towards the close of 1607 he sent to his friends a small tract, entitled *Cogitata et Visa*, probably the first draft of what we have under that title. In 1609 he wrote the noble panegyric, *In felicem memoriam Elizabethae*, and the curiously learned and ingenious work, *De Sapientia Veterum*; and completed what seems to have been the *Redargutio Philosophiarum*, or treatise on the "idols of the theatre."

In 1610 the famous fourth parliament of James met. Prerogative, despite Bacon's advice and efforts, clashed more than once with liberty; Salisbury's bold schemes for relieving the embarrassment caused by the reckless extravagance of the king proved abortive, and the House was dissolved in

February 1611. Bacon took a considerable share in the debates, consistently upheld the prerogative, and seemed yet to possess the confidence of the Commons. The death of Salisbury, occurring soon after, opened a position in which Bacon thought his great political skill and sagacity might be made more immediately available for the king's service. How far he directly offered himself for the post of secretary is uncertain, but we know that his hopes were disappointed, the king himself undertaking the duties of the office. About the same time he made two ineffectual applications for the mastership of the wards; the first, on Salisbury's death, when it was given to Sir George Carey; the second, on the death of Carey. It is somewhat hard to understand why so little favour was shown by the king to one who had proved himself able and willing to do good service, and who, in spite of his disappointments, still continued zealously to offer advice and assistance. At last in 1613, a fair opportunity for promotion occurred. The death of Sir Thomas Fleming made a vacancy in the chief justiceship of the king's bench, and Bacon, after some deliberation, proposed to the king that Coke should be removed from his place in the court of common pleas and transferred to the king's bench. He gives several reasons for this in his letter to the king, but in all probability his chief motive was that pointed out by Spedding, that in the court of king's bench there would be less danger of Coke coming into collision with the king on questions of prerogative, in handling which Bacon was always very circumspect and tender. The vacancy caused by Coke's promotion was then filled up by Hobart, and Bacon, finally, stepped into the place of attorney-general. The fact of this advice being offered and followed in all essentials, illustrates very clearly the close relations between the king and Bacon, who had become a confidential adviser on most occasions of difficulty. That his adherence to the royal party was already noticed and commented on appears from the significant remark of Chamberlain, who, after mentioning the recent changes among the law officials, says, "There is a strong apprehension that ... Bacon may prove a dangerous instrument."

Further light is thrown upon Bacon's relations with James, and upon his political sympathies, by the letter to the king advocating the calling of a

parliament, and by the two papers of notes on which his letter was founded. These documents, even after due weight is given to all considerations urged in their favour, seem to confirm the view already taken of Bacon's theory of government, and at the same time show that his sympathies with the royal party tended to blind him to the true character of certain courses of action, which can only be justified by a straining of political ethics. The advice he offered, in all sincerity, was most prudent and sagacious, and *might* have been successfully carried out by a man of Bacon's tact and skill; but it was intensely one-sided, and exhibited a curious want of appreciation of what was even then beginning to be looked on as the true relation of king, parliament and people. Unfortunately for James, he could neither adopt nor carry out Bacon's policy. The parliament which met in April 1614, in which Bacon sat for Cambridge University, and was dissolved in June, after a stormy session, was by no means in a frame of mind suitable for the king's purposes. The House was enraged at the supposed project (then much misunderstood) of the "Undertakers"; objection was taken to Bacon being elected or serving as a member while holding office as attorney-general; and, though an exception was made in his favour, it was resolved that no attorney-general should in future be eligible for a seat in parliament. No supply was granted, and the king's necessities were increased instead of diminished. The emergency suggested to some of the bishops the idea of a voluntary contribution, which was eagerly taken up by the noblemen and crown officials. The scheme was afterwards extended so as to take in the whole kingdom, but lost something of its voluntary character, and the means taken to raise the money, which were not what Bacon would have recommended, were calculated to stir up discontent. The general dissatisfaction received a somewhat unguarded and intemperate expression in a letter sent to the justices of Marlborough by a gentleman of the neighbourhood, named Oliver St John, in which he denounced the attempt to raise funds in this way as contrary to law, reason and religion, as constituting in the king personally an act of perjury, involving in the same crime those who contributed, and thereby subjecting all parties to the curses levelled by the church at such offences. St John was summoned before the Star Chamber

for slander and treasonable language; and Bacon, *ex officio*, acted as public prosecutor. The sentence pronounced (a fine of £5000 and imprisonment for life) was severe, but it was not actually inflicted, and probably was not intended to be carried out, the success of the prosecution being all that was desired. St John remained a short time in prison, and was then released, after making a full apology and submission. The fine was remitted. It seems incredible that Bacon's conduct on this occasion should have been censured by his biographers. The offence was clear; the law was undoubted; no particular sympathy was excited for the culprit; the sentence was not carried out; and Bacon did only what any one in his place would naturally and necessarily have done. The nature of his office involved him in several trials for treason occurring about the same time, and one of these is of interest sufficient to require a somewhat longer examination. Edmund Peacham had been committed to custody for a libel on his superior, James Montagu (1568?-1618), bishop of Bath and Wells. In searching his house for certain papers, the officers came upon some loose sheets stitched together in the form of a sermon, the contents of which were of such a nature that it was judged right to lay them before the council. As it was at first suspected that the writing of this book had been prompted by some disaffected persons, Peacham was interrogated, and after he had declined to give any information, was subjected to torture. Bacon, as one of the learned counsel, was ordered by the council to take part in this examination, which was undoubtedly warranted by precedent, whatever may now be thought of it. Nothing, however, was extracted from Peacham in this way, and it was resolved to proceed against him for treason. Now, in the excited state of popular feeling at that period, the failure of government to substantiate an accusation of treason would have been a serious matter. The king, with whom the council agreed, seems therefore to have thought it desirable to obtain beforehand the opinions of the four chief judges as to whether the alleged offence amounted to treason. In this there was nothing unusual or illegal, and no objection would at that time have been made to it, but James introduced a certain innovation; he proposed that the opinions of the four judges should be given separately and in private. It may be reasonably inferred

that his motive for this was the suspicion, or it may be the knowledge, that Coke did not consider the matter treasonable. At all events when Coke, who as a councillor already knew the facts of the case, was consulted regarding the new proposal of the king, he at once objected to it, saying that "this particular and auricular taking of opinions" was "new and dangerous," and "not according to the custom of the realm." He at last reluctantly assented, and proposed that Bacon should consult with him, while the other law officers addressed themselves to the three puisne judges. By Bacon's directions the proposal to the three judges to give their opinions separately was made suddenly and confidently, and any scruples they might have felt were easily overcome. The first step was thus gained, and it was hoped that if "infusion" could be avoided, if the papers bearing on the case were presented to the judges quickly, and before their minds could be swayed by extraneous influence, their decision on the case would be the same as that of the king. It is clear that the extraneous influence to be feared was Coke, who, on being addressed by Bacon, again objected to giving his opinion separately, and even seemed to hope that his brother judges after they had seen the papers would withdraw their assent to giving their decisions privately. Even after the discussion of the case with Bacon, he would not give his opinion until the others had handed in theirs. What the other judges thought is not definitely known, but Bacon appears to have been unable to put in operation the plan he had devised for swaying Coke's judgment, or if he did attempt it, he was unsuccessful, for Coke finally gave an opinion consistent with what he seems to have held at first, that the book was not treasonable, as it did not disable the king's title. Although the opinions of the judges were not made public, yet as we learn, not only from Bacon, but from a sentence in one of Carleton's letters, a rumour had got about that there was doubt as to the book being treasonable. Under these circumstances, Bacon, who feared that such a report might incite other people to attempt a similar offence, proposed to the king that a second rumour should be circulated in order to destroy the impression caused by the first. "I do think it necessary," he says, "that because we live in an age in which no counsel is kept, and that it is true

there is some bruit abroad that the judges of the king's bench do doubt of the case that it should not be treason, that it be given out constantly, and yet as it were in secret, and so a fame to slide, that the doubt was only upon the publication, in that it was never published. For that (if your majesty marketh it) taketh away or at least qualifieth the danger of the example; for that will be no man's case." Bacon's conduct in this matter has been curiously misrepresented. He has been accused of torturing the prisoner, and of tampering with the judges by consulting them before the trial; nay, he is even represented as selecting this poor clergyman to serve for an example to terrify the disaffected, as breaking into his study and finding there a sermon never intended to be preached, which merely encouraged the people to resist tyranny. All this lavish condemnation rests on a complete misconception of the case. If any blame attaches to him, it must arise either from his endeavour to force Coke to a favourable decision, in which he was in all probability prompted by a feeling, not uncommon with him, that a matter of state policy was in danger of being sacrificed to some senseless legal quibble or precedent, or from his advice to the king that a rumour should be set afloat which was not strictly true.

Bacon's share in another great trial which came on shortly afterwards, the Overbury and Somerset case, is not of such a nature as to render it necessary to enter upon it in detail. It may be noted, however, that his letters about this time show that he had become acquainted with the king's new favourite, the brilliant Sir George Villiers, and that he stood high in the king's good graces. In the early part of 1616, when Thomas Egerton, Baron Ellesmere (*c.* 1540-1617), the lord chancellor, was dangerously ill, Bacon wrote a long and careful letter to the king, proposing himself for the office, should it fall vacant, and stating as frankly as possible of what value he considered his services would be. In answer, he appears to have received a distinct promise of the reversion of the office; but, as Ellesmere recovered, the matter stood over for a time. He proposed, however, that he should be made a privy councillor, in order to give him more weight in his almost recognized position of adviser to the king, and on the 9th of June 1616 he took the oaths and his seat at the council board.

Meanwhile, his great rival Coke, whose constant tendency to limit the prerogative by law and precedent had made him an object of particular dislike to James, had on two points come into open collision with the king's rights. The first case was an action of *praemunire* against the court of chancery, evidently instigated by him, but brought at the instance of certain parties whose adversaries had obtained redress in the chancellor's court after the cause had been tried in the court of king's bench. With all his learning and ingenuity Coke failed in inducing or even forcing the jury to bring in a bill against the court of chancery, and it seems fairly certain that on the technical point of law involved he was wrong. Although his motive was, in great measure, a feeling of personal dislike towards Ellesmere, yet it is not improbable that he was influenced by the desire to restrict in every possible way the jurisdiction of a court which was the direct exponent of the king's wishes. The other case, that of the *commendams*, was more important in itself and in the circumstances connected with it. The general question involved in a special instance was whether or not the king's prerogative included the right of granting at pleasure livings in *commendam*, *i.e.* to be enjoyed by one who was not the incumbent. Bacon, as attorney-general, delivered a speech, which has not been reported; but the king was informed that the arguments on the other side had not been limited to the special case, but had directly impugned the general prerogative right of granting livings. It was necessary for James, as a party interested, at once to take measures to see that the decision of the judges should not be given on the general question without due consultation. He accordingly wrote to Bacon, directing him to intimate to the judges his pleasure that they should delay judgment until after discussion of the matter with himself. Bacon communicated first with Coke, who in reply desired that similar notice should be given to the other judges. This was done by Bacon, though he seems to hint that in so doing he was going a little beyond his instructions. The judges took no notice of the intimation, proceeded at once to give judgment, and sent a letter in their united names to the king announcing what they had done, and declaring that it was contrary to law and to their oath for them to pay any attention to a request that their decision should be delayed.

The king was indignant at this encroachment, and acting partly on the advice of Bacon, held a council on the 6th of June 1616, at which the judges attended. James then entered at great length into the case, censuring the judges for the offensive form of their letter, and for not having delayed judgment upon his demand, which had been made solely because he was himself a party concerned. The judges, at the conclusion of his speech, fell on their knees, and implored pardon for the manner of their letter; but Coke attempted to justify the matter contained in it, saying that the delay required by his majesty was contrary to law. The point of law was argued by Bacon, and decided by the chancellor in favour of the king, who put the question to the judges individually, "Whether, if at any time, in a case depending before the judges, which his majesty conceived to concern him either in power or profit, and thereupon required to consult with them, and that they should stay proceedings in the meantime, they ought not to stay accordingly?" To this all gave assent except Coke, who said that "when the case should be, he would do that should be fit for a judge to do." No notice was taken by the king of this famous, though somewhat evasive, reply, But the judges were again asked what course they would take in the special case now before them. They all declared that they would not decide the matter upon general grounds affecting the prerogative, but upon special circumstances incident to the case; and with this answer they were dismissed. Bacon's conduct throughout the affair has been blamed, but apparently on wrong grounds. As attorney he was merely fulfilling his duty in obeying the command of the king; and in laying down the law on the disputed point, he was, we may be sure, speaking his own convictions. Censure might more reasonably be bestowed on him because he deliberately advised a course of action than which nothing can be conceived better calculated to strengthen the hands of an absolute monarch. This appeared to Bacon justifiable and right, because the prerogative would be defended and preserved intact. Coke certainly stands out in a better light, not so much for his answer, which was rather indefinite, and the force of which is much weakened by his assent to the second question of the king, but for the general spirit of resistance to encroachment exhibited by him. He was undeniably

troublesome to the king, and it is no matter for wonder that James resolved to remove him from a position where he could do so much harm. On the 26th June he was called before the council to answer certain charges, one of which was his conduct in the *praemunire* question. He acknowledged his error on that head, and made little defence. On the 30th he was suspended from council and bench, and ordered to employ his leisure in revising certain obnoxious opinions in his reports. He did not perform the task to the king's satisfaction, and a few months later he was dismissed from office.

Bacon's services to the king's cause had been most important; and as he had, at the same time, acquired great favour with Villiers, his prospects looked brighter than before. According to his custom, he strove earnestly to guide by his advice the conduct of the young favourite. His letters, in which he analyses the various relations in which such a man must stand, and prescribes the course of action suitable for each, are valuable and deserving of attention. Very striking, in view of future events, are the words in which he gives him counsel as to his dealing with judges: "By no means be you persuaded to interpose yourself by word or letter in any cause depending, or like to be depending, in any court of justice, nor suffer any man to do it where you can hinder it; and by all means dissuade the king himself from it, upon the importunity of any, either for their friends or themselves. If it should prevail, it perverts justice; but if the judge be so just, and of so undaunted a courage (as he ought to be) as not to be inclined thereby, yet it always leaves a taint of suspicions and prejudice behind it." It is probable that Villiers at this time had really a sense of the duties attaching to his position and was willing to be guided by a man of approved wisdom. It was not long before an opportunity occurred for showing his gratitude and favour. Ellesmere resigned the chancellorship on the 5th of March 1616/7, and on the 7th the great seal was bestowed upon Bacon, with the title of lord keeper. Two months later he took his seat with great pomp in the chancery court, and delivered a weighty and impressive opening discourse. He entered with great vigour on his new labours, and in less than a month he was able to report to Buckingham that he had cleared off all outstanding chancery cases. He seemed

now to have reached the height of his ambition; he was the first law officer in the kingdom, the accredited minister of his sovereign, and on the best terms with the king and his favourite. His course seemed perfectly prosperous and secure, when a slight storm arising opened his eyes to the frailty of the tenure by which he held his position.

Coke was in disgrace but not in despair; there seemed to be a way whereby he could reconcile himself to Buckingham, through the marriage of his daughter, who had an ample fortune, to Sir John Villiers, brother of the marquess, who was penniless or nearly so. The match was distasteful to Lady Hatton and to her daughter; a violent quarrel was the consequence, and Bacon, who thought the proposed marriage most unsuitable, took Lady Hatton's part. His reasons for disapproval he explained to the king and Buckingham, but found to his surprise that their indignation was strongly roused against him. He received from both bitter letters of reproof; it was rumoured that he would be disgraced, and Buckingham was said to have compared his present conduct to his previous unfaithfulness to Essex. Bacon, who seems to have acted from a simple desire to do the best for Buckingham's own interests, at once changed his course, advanced the match by every means in his power, and by a humble apology appeased the indignation that had been excited against him. It had been a sharp lesson, but things seemed to go on smoothly after it, and Bacon's affairs prospered.

On the 4th of January 1617/8 he received the higher title of lord chancellor; in July of the same year he was made Baron Verulam and in January 1620/1 he was created Viscount St Albans. His fame, too, had been increased by the publication in 1620 of his most celebrated work, the *Novum Organum*. He seemed at length to have made satisfactory progress towards the realization of his cherished aims; the method essential for his Instauration was partially completed; and he had attained as high a rank in the state as he had ever contemplated. But his actions in that position were not calculated to promote the good of his country.

Connected with the years during which he held office is one of the weightiest charges against his character. Buckingham, notwithstanding the advice he had

received from Bacon himself, was in the habit of addressing letters to him recommending the causes of suitors. In many cases these seem nothing more than letters of courtesy, and, from the general tone, it might fairly be concluded that there was no intention to sway the opinion of the judge illegally, and that Bacon did not understand the letters in that sense. This view is supported by consideration of the few answers to them which are extant. One outstanding case, however, that of Dr Steward, casts some suspicion on all the others. The terms of Buckingham's note concerning it might easily have aroused doubts; and we find that the further course of the action was to all appearances exactly accommodated to Dr Steward, who had been so strongly recommended. It is, of course, dangerous to form an extreme judgment on an isolated and partially understood case, of which also we have no explanation from Bacon himself, but if the interpretation advanced by Heath be the true one, Bacon certainly suffered his first, and, so far as we can see, just judgment on the case to be set aside, and the whole matter to be reopened in obedience to a request from Buckingham.

It is somewhat hard to understand Bacon's position with regard to the king during these years. He was the first officer of the crown, the most able man in the kingdom, prudent, sagacious and devoted to the royal party. Yet his advice was followed only when it chimed in with James's own will; his influence was of a merely secondary kind; and his great practical skill was employed simply in carrying out the measures of the king in the best mode possible. We know indeed that he sympathized cordially with the home policy of the government; he had no objection to such monopolies or patents as seemed advantageous to the country, and for this he is certainly not to be blamed. The opinion was common at the time, and the error was merely ignorance of the true principles of political economy. But we know also that the patents were so numerous as to be oppressive, and we can scarcely avoid inferring that Bacon more readily saw the advantages to the government than the disadvantages to the people. In November 1620, when a new parliament was summoned to meet on January following, he earnestly pressed that the most obnoxious patents, those of alehouses and inns, and the monopoly of gold and silver thread, should be given up, and wrote to

Buckingham, whose brothers were interested, advising him to withdraw them from the impending storm. This prudent advice was unfortunately rejected. But while he went cordially with the king in domestic affairs, he was not quite in harmony with him on questions of foreign policy. Not only was he personally in favour of a war with Spain for the recovery of the Palatinate, but he foresaw in such a course of action the means of drawing together more closely the king and his parliament. He believed that the royal difficulties would be removed if a policy were adopted with which the people could heartily sympathize, and if the king placed himself at the head of his parliament and led them on. But his advice was neglected by the vacillating and peace-loving monarch, his proffered proclamation was put aside, and a weak, featureless production substituted in its place. Nevertheless the new parliament seemed at first more responsive than might have been looked for. A double subsidy was granted, which was expressly stated to be "not on any consideration or condition for or concerning the Palatinate." The session, however, was not far advanced when the question of patents was brought up; a determined attack was made upon the very ones of which Bacon had been in dread, and it was even proposed to proceed against the referees (Bacon and Montagu) who had certified that there was no objection to them in point of law. This proposal, though pressed by Coke, was allowed to drop; while the king and Buckingham, acting under the advice of Williams, afterwards lord keeper, agreed to give up the monopolies. It was evident, however, that a determined attack was about to be made upon Bacon, and that the proceeding against the referees was really directed against him. It is probable that this charge was dropped because a more powerful weapon had in the meantime been placed in his enemies' hands. This was the accusation of bribery and corrupt dealings in chancery suits, an accusation apparently wholly unexpected by Bacon, and the possibility of which he seems never to have contemplated until it was actually brought against him. At the beginning of the session a committee had been appointed for inquiring into abuses in the courts of justice. Some illegal practices of certain chancery officials had been detected and punished by the court itself, and generally there was a disposition to overhaul its

affairs, while Coke and Lionel Cranfield, earl of Middlesex (1575-1645) directly attacked some parts of the chancellor's administration. But on the 14th of March one Christopher Aubrey appeared at the bar of the House, and charged Bacon with having received from him a sum of money while his suit was going on, and with having afterwards decided against him. Bacon's letter on this occasion is worthy of serious attention; he evidently thought the charge was but part of the deliberate scheme to ruin him which had already been in progress. A second accusation (Edward Egerton's case) followed immediately after, and was investigated by the House, who, satisfied that they had just matter for reprehension, appointed the 19th for a conference with the Lords. On that day Bacon, as he had feared, was too ill to attend. He wrote to the Lords excusing his absence, requesting them to appoint a convenient time for his defence and cross-examination of witnesses, and imploring them not to allow their minds to be prejudiced against him, at the same time declaring that he would not "trick up an innocency with cavillations, but plainly and ingenuously declare what he knew or remembered." The charges rapidly accumulated, but Bacon still looked upon them as party moves, and was in hopes of defending himself. Nor did he seem to have lost his courage, if we are to believe the common reports of the day, though certainly they do not appear worthy of very much credit.

The notes bearing upon the interview which he obtained with the king show that he had begun to see more clearly the nature and extent of the offences with which he was charged, that he now felt it impossible altogether to exculpate himself, and that his hopes were directed towards obtaining some mitigation of his sentence. The long roll of charges made upon the 19th of April finally decided him; he gave up all idea of defence, and wrote to the king begging him to show him favour in this emergency. The next day he sent in a general confession to the Lords, trusting that this would be considered satisfactory. The Lords, however, decided that it was not sufficient as a ground for their censure, and demanded a detailed and particular confession. A list of twenty-eight charges was then sent him, to which an answer by letter was required. On the 30th of April his "confession and humble submission" was handed in. In it, after

going over the several instances, he says, “I do again confess, that on the points charged upon me, although they should be taken as myself have declared them, there is a great deal of corruption and neglect; for which I am heartily and penitently sorry, and submit myself to the judgment, grace, and mercy of the court.” On the 3rd of May, after considerable discussion, the Lords decided upon the sentence, which was, That he should undergo fine and ransom of £40,000; that he should be imprisoned in the Tower during the king’s pleasure; that he should be for ever incapable of any office, place or employment in the state or commonwealth; that he should never sit in parliament, or come within the verge of the court. This heavy sentence was only partially executed. The fine was in effect remitted by the king; imprisonment in the Tower lasted for about four days; a general pardon (not of course covering the parliamentary censure) was made out, and though delayed at the seal for a time by Lord Keeper Williams, was passed probably in November 1621. The cause of the delay seems to have lain with Buckingham, whose friendship had cooled, and who had taken offence at the fallen chancellor’s unwillingness to part with York House. This difference was finally smoothed over, and it was probably through his influence that Bacon received the much-desired permission to come within the verge of the court. He never again sat in parliament.

So ends this painful episode, which has given rise to the most severe condemnation of Bacon, and which still presents great and perhaps insuperable difficulties. On the whole, the tendency of the most recent and thorough researches has been towards the opinion that Bacon’s own account of the matter (from which, indeed, our knowledge of it is chiefly drawn) is substantially correct. He distinguishes three ways in which bribes may be given, and ingenuously confesses that his own acts amounted to corruption and were worthy of condemnation. Now, corruption strictly interpreted would imply the deliberate sale of justice, and this Bacon explicitly denies, affirming that he never “had bribe or reward in his eye or thought when he pronounced any sentence or order.” When we analyse the specific charges against him, with his answers to them, we find many that are really of little weight. The twenty-eighth

and last, that of negligence in looking after his servants, though it did him much harm, may fairly be said to imply no moral blame. The majority of the others are instances of gratuities given after the decision, and it is to be regretted that the judgment of the peers gives us no means of determining how such gifts were looked upon, whether or not the acceptance of them was regarded as a "corrupt" practice. In four cases specifically, and in some others by implication, Bacon confesses that he had received bribes from suitors *pendente lite*. Yet he affirms, as we said before, that his intention was never swayed by a bribe; and so far as any of these cases can be traced, his decisions, often given in conjunction with some other official, are to all appearance thoroughly just. In several cases his judgment appears to have been given against the party bestowing the bribe, and in at least one instance, that of Lady Wharton, it seems impossible to doubt that he must have known when accepting the present that his opinion would be adverse to her cause. Although, then, he felt that these practices were really corrupt, and even rejoiced that his own fall would tend to purify the courts from them, he did not feel that he was guilty of perverting justice for the sake of reward. How far, then, is such defence or explanation admissible and satisfactory? It is clear that two things are to be considered: the one the guilt of taking bribes or presents on any consideration, the other the moral guilt depending upon the wilful perversion of justice. The attempt has sometimes been made to defend the whole of Bacon's conduct on the ground that he did nothing that was not done by many of his contemporaries. Bacon himself disclaims a defence of this nature, and we really have no direct evidence which shows to what extent the offering and receiving of such bribes then prevailed. That the practice was common is indeed implied by the terms in which Bacon speaks of it, and it is not improbable that the fact of these gifts being taken by officials was a thing fairly well known, although all were aware of their illegal character, and it was plain that any public exposure of such dealings would be fatal to the individual against whom the charge was made out. Bacon knew all this; he was well aware that the practice was in itself indefensible, and that his conduct was therefore corrupt and deserving of censure. So far, then, as the mere taking of

bribes is concerned, he would permit no defence, and his own confession and judgment on his action contain as severe a condemnation as has ever been passed upon him. Yet in the face of this he does not hesitate to call himself "the justest chancellor that hath been in the five changes since Sir Nicholas Bacon's time"; and this on the plea that his intentions had always been pure, and had never been affected by the presents he received. His justification has been set aside by modern critics, not on the ground that the evidence demonstrates its falsity, but because it is inconceivable or unnatural that any man should receive a present from another, and not suffer his judgment to be swayed thereby. It need hardly be said that such an *a priori* conviction is not a sufficient basis on which to found a sweeping condemnation of Bacon's integrity as an administrator of justice. On the other hand, even if it be admitted to be possible and conceivable that a present should be given by a suitor simply as seeking favourable consideration of his cause, and not as desirous of obtaining an unjust decree, and should be accepted by the judge on the same understanding, this would not entitle one absolutely to accept Bacon's statement. Further evidence is necessary in order to give foundation to a definite judgment either way; and it is extremely improbable, nay, almost impossible, that such can ever be produced. In these circumstances, due weight should be given to Bacon's own assertions of his perfect innocence and purity of intention; they ought not to be put out of court unless found in actual contradiction to the facts, and the reverse of this is the case, so far as has yet appeared.

The remaining five years of his life, though he was still harassed by want of means, for James was not liberal, were spent in work far more valuable to the world than anything he had accomplished in his high office. In March 1622 he presented to Prince Charles his *History of Henry VII.*; and immediately, with unwearied industry, set to work to complete some portions of his great work. In November 1622 appeared the *Historia Ventorum*; in January 1622/3, the *Historia Vitae et Mortis*; and in October of the same year, the *De Augmentis Scientiarum*, a Latin translation, with many additions, of the *Advancement*. Finally, in December 1624, he published his *Apophthegms*, and *Translations of*

some of the Psalms, dedicated to George Herbert; and, in 1625, a third and enlarged edition of the *Essays*.

Busily occupied with these labours, his life now drew rapidly to a close. In March 1626 he came to London, and when driving one day near Highgate, was taken with a desire to discover whether snow would act as an antiseptic. He stopped his carriage, got out at a cottage, purchased a fowl, and with his own hands assisted to stuff it with snow. He was seized with a sudden chill, and became so seriously unwell that he had to be conveyed to Lord Arundel's house, which was near at hand. Here his illness increased, the cold and chill brought on bronchitis and he died, after a few days' suffering, on the 9th of April 1626.

Bacon's Works and Philosophy.

A complete survey of Bacon's works and an estimate of his place in literature and philosophy are matters for a volume. It is here proposed merely to classify the works, to indicate their general character and to enter somewhat more in detail upon what he himself regarded as his great achievement, — the reorganization of the sciences and the exposition of a new method by which the human mind might proceed with security and certainty towards the true end of all human thought and action.

Putting aside the letters and occasional writings, we may conveniently distribute the other works into three classes, *Professional, Literary, Philosophical*. The Professional works include the *Reading on the Statute of Uses*, the *Maxims of Law* and the treatise (possibly spurious) on the *Use of the Law*. "I am in good hope," said Bacon himself, "that when Sir Edward Coke's reports and my rules and decisions shall come to posterity, there will be (whatsoever is now thought) question who was the greater lawyer." If Coke's reports show completer mastery of technical details, greater knowledge of precedent, and more of the dogged grasp of the letter than do Bacon's legal writings, there can be no dispute that the latter exhibit an infinitely more comprehensive intelligence of the abstract principles of jurisprudence, with a richness and ethical fulness that more than compensate for their lack of dry legal detail. Bacon seems indeed to have been a lawyer of the first order, with a keen

scientific insight into the bearings of isolated facts and a power of generalization which admirably fitted him for the self-imposed task, unfortunately never completed, of digesting or codifying the chaotic mass of the English law.

Among the literary works are included all that he himself designated moral and historical pieces, and to these may be added some theological and minor writings, such as the *Apophthegms*. Of the moral works the most valuable are the *Essays*, which have been so widely read and universally admired. The matter is of the familiar, practical kind, that "comes home to men's bosoms." The thoughts are weighty, and even when not original have acquired a peculiar and unique tone or cast by passing through the crucible of Bacon's mind. A sentence from the *Essays* can rarely be mistaken for the production of any other writer. The short, pithy sayings have become popular mottoes and household words. The style is quaint, original, abounding in allusions and witticisms, and rich, even to gorgeousness, with piled-up analogies and metaphors. The first edition contained only ten essays, but the number was increased in 1612 to thirty-eight, and in 1625 to fifty-eight. The short tract, *Colours of Good and Evil*, which with the *Meditationes Sacrae* originally accompanied the Essays, was afterwards incorporated with the *De Augmentis*. Along with these works may be classed the curiously learned piece, *De Sapientia Veterum*, in which he works out a favourite idea, that the mythological fables of the Greeks were allegorical and concealed the deepest truths of their philosophy. As a scientific explanation of the myths the theory is of no value, but it affords fine scope for the exercise of Bacon's unrivalled power of detecting analogies in things apparently most dissimilar. The *Apophthegms*, though hardly deserving Macaulay's praise of being the best collection of jests in the world, contain a number of those significant anecdotes which Bacon used with such effect in his other writings. Of the historical works, besides a few fragments of the projected history of Britain there remains the *History of Henry VII.*, a valuable work, giving a clear and animated narrative of the reign, and characterizing Henry with great skill. The style is in harmony with the matter, vigorous and flowing, but naturally with less of the quaintness and richness suitable to more thoughtful and original writings.

The series of the literary works is completed by the minor treatises on theological or ecclesiastical questions. Some of the latter, included among the occasional works, are sagacious and prudent and deserve careful study. Of the former, the principal specimens are the *Meditationes Sacrae* and the *Confession of Faith*. The *Paradoxes* (Characters of a believing Christian in paradoxes, and seeming contradictions), which was often and justly suspected, has been conclusively proved by Grosart to be the work of another author.

Philosophical Works. — The great mass of Bacon's writings consists of treatises or fragments, which either formed integral parts of his grand comprehensive scheme, or were closely connected with it. More exactly they may be classified under three heads: (A) Writings originally intended to form parts of the *Instauratio*, but which were afterwards superseded or thrown aside; (B) Works connected with the *Instauratio*, but not directly included in its plan; (C) Writings which actually formed part of the *Instauratio Magna*.

(A) This class contains some important tracts, which certainly contain little, if anything, that is not afterwards taken up and expanded in the more elaborate works, but are not undeserving of attention, from the difference in the point of view and method of treatment. The most valuable of them are: (1) The *Advancement of Learning*, of which no detailed account need be given, as it is completely worked up into the *De Augmentis*, and takes its place as the first part of the *Instauratio*. (2) *Valerius Terminus*, a very remarkable piece, composed probably about 1603, though perhaps retouched at a later period. It contains a brief and somewhat obscure outline of the first two parts in the *Instauratio*, and is of importance as affording us some insight into the gradual development of the system in Bacon's own mind. (3) *Temporis Partus Masculus*, another curious fragment, remarkable not only from its contents, but from its style, which is arrogant and offensive, in this respect unlike any other writing of Bacon's. The adjective *masculus* points to the power of bringing forth fruit possessed by the new philosophy, and perhaps indicates that all previous births of time were to be looked upon as feminine or imperfect; it is used in a somewhat similar sense in *Letters and Life*, vi. 183, "*In verbis masculis*, no flourishing or painted words,

but such words as are fit to go before deeds." (4) *Redargutio Philosophiarum*, a highly finished piece in the form of an oration, composed probably about 1608 or 1609, and containing in pretty full detail much of what afterwards appears in connexion with the *Idola Theatri* in book i. of the *Novum Organum*. (5) *Cogitata et Visa*, perhaps the most important of the minor philosophical writings, dating from 1607 (though possibly the tract in its present form may have been to some extent altered), and containing in weighty and sonorous Latin the substance of the first book of the *Organum*. (6) The *Descriptio Globi Intellectualis*, which is to some extent intermediate between the *Advancement* and the *De Augmentis*, goes over in detail the general classification of the sciences, and enters particularly on some points of minor interest. (7) The brief tract *De Interpretatione Naturae Sententiae Duodecim* is evidently a first sketch of part of the *Novum Organum*, and in phraseology is almost identical with it. (8) A few smaller pieces, such as the *Inquisitio de Motu*, the *Calor et Frigus*, the *Historia Soni et Auditus* and the *Phaenomena Universi*, are early specimens of his *Natural History*, and exhibit the first tentative applications of the new method.

(B) The second group consists of treatises on subjects connected with the *Instauratio*, but not forming part of it. The most interesting, and in many respects the most remarkable, is the philosophic romance, the *New Atlantis*, a description of an ideal state in which the principles of the new philosophy are carried out by political machinery and under state guidance, and where many of the results contemplated by Bacon are in imagination attained. The work was to have been completed by the addition of a second part, treating of the laws of a model commonwealth, which was never written. Another important tract is the *De Principiis atque Originibus secundum Fabulas Cupidinis et Caeli*, where, under the disguise of two old mythological stories, he (in the manner of the *Sapientia Veterum*) finds the deepest truths concealed. The tract is unusually interesting, for in it he discusses at some length the limits of science, the origin of things and the nature of primitive matter, giving at the same time full notices of Democritus among the ancient philosophers and of Telesio among the modern. Deserving of attention are also the *Cogitationes de Natura Rerum*,

probably written early, perhaps in 1605, and the treatise on the theory of the tides, *De Fluxu et Refluxu Maris*, written probably about 1616.

(C) The philosophical works which form part of the *Instauratio* must of course be classed according to the positions which they respectively hold in that scheme of the sciences.

The great work, the reorganization of the sciences, and the restoration of man to that command over nature which he had lost by the fall, consisted in its final form of six divisions.

I. *Partitiones Scientiarum*, a survey of the sciences, either such as then existed or such as required to be constructed afresh — in fact, an inventory of all the possessions of the human mind. The famous classification on which this survey proceeds is based upon an analysis of the faculties and objects of human knowledge. This division is represented by the *De Augmentis Scientiarum*.

II. *Interpretatio Naturae*. — After the survey of all that has yet been done in the way of discovery or invention, comes the new method, by which the mind of man is to be trained and directed in its progress towards the renovation of science. This division is represented, though only imperfectly, by the *Novum Organum*, particularly book ii.

III. *Historia Naturalis et Experimentalis*. — The new method is valueless, because inapplicable, unless it be supplied with materials duly collected and presented — in fact, unless there be formed a competent natural history of the *Phaenomena Universi*. A short introductory sketch of the requisites of such a natural history, which, according to Bacon, is essential, necessary, the *basis totius negotii*, is given in the tract *Parasceve*, appended to the *Novum Organum*. The principal works intended to form portions of the history, and either published by himself or left in manuscript, are *Historia Ventorum, Historia Vitae et Mortis, Historia Densi et Rari*, and the extensive collection of facts and observations entitled *Sylva Sylvarum*.

IV. *Scala Intellectus*. — It might have been supposed that the new philosophy could now be inaugurated. Materials had been supplied, along with a new method by which they were to be treated, and naturally the next step would be

the finished result. But for practical purposes Bacon interposed two divisions between the preliminaries and the philosophy itself. The first was intended to consist of types or examples of investigations conducted by the new method, serviceable for keeping the whole process vividly before the mind, or, as the title indicates, such that the mind could run rapidly up and down the several steps or grades in the process. Of this division there seems to be only one small fragment, the *Filum Labyrinthi*, consisting of but two or three pages.

V. *Prodromi*, forerunners of the new philosophy. This part, strictly speaking, is quite extraneous to the general design. According to the *Distributio Operis*, it was to contain certain speculations of Bacon's own, not formed by the new method, but by the unassisted use of his understanding. These, therefore, form temporary or uncertain anticipations of the new philosophy. There is extant a short preface to this division of the work, and according to Spedding some of the miscellaneous treatises, such as *De Principiis, De Fluxu et Refluxu, Cogitationes de Natura Rerum*, may probably have been intended to be included under this head. This supposition receives some support from the manner in which the fifth part is spoken of in the *Novum Organum*, i. 116.

VI. The new philosophy, which is the work of future ages, and the result of the new method.

Bacon's grand motive in his attempt to found the sciences anew was the intense conviction that the knowledge man possessed was of little service to him. "The knowledge whereof the world is now possessed, especially that of nature, extendeth not to magnitude and certainty of works." Man's sovereignty over nature, which is founded on knowledge alone, had been lost, and instead of the free relation between things and the human mind, there was nothing but vain notions and blind experiments. To restore the original commerce between man and nature, and to recover the *imperium hominis*, is the grand object of all science. The want of success which had hitherto attended efforts in the same direction had been due to many causes, but chiefly to the want of appreciation of the nature of philosophy and its real aim. Philosophy is not the science of things divine and human; it is not the search after truth. "I find that even those that have

sought knowledge for itself, and not for benefit or ostentation, or any practical enablement in the course of their life, have nevertheless propounded to themselves a wrong mark, namely, satisfaction (which men call Truth) and not operation." "Is there any such happiness as for a man's mind to be raised above the confusion of things, where he may have the prospect of the order of nature and error of man? But is this a view of delight only and not of discovery? of contentment and not of benefit? Shall he not as well discern the riches of nature's warehouse as the beauty of her shop? Is truth ever barren? Shall he not be able thereby to produce worthy effects, and to endow the life of man with infinite commodities?" Philosophy is altogether practical; it is of little matter to the fortunes of humanity what abstract notions one may entertain concerning the nature and the principles of things. This truth, however, has never yet been recognized; it has not yet been seen that the true aim of all science is "to endow the condition and life of man with new powers or works," or "to extend more widely the limits of the power and greatness of man." Nevertheless, it is not to be imagined that by this being proposed as the great object of search there is thereby excluded all that has hitherto been looked upon as the higher aims of human life, such as the contemplation of truth. Not so, but by following the new aim we shall also arrive at a *true* knowledge of the universe in which we are, for without knowledge there is no power; truth and utility are in ultimate aspect the same; "works themselves are of greater value as pledges of truth than as contributing to the comforts of life." Such was the conception of philosophy with which Bacon started, and in which he felt himself to be thoroughly original. As his object was new and hitherto unproposed, so the method he intended to employ was different from all modes of investigation hitherto attempted. "It would be," as he says, "an unsound fancy and self-contradictory, to expect that things which have never yet been done can be done except by means which have never yet been tried." There were many obstacles in his way, and he seems always to have felt that the first part of the new scheme must be a *pars destruens*, a destructive criticism of all other methods. Opposition was to be expected, not only from previous philosophies, but especially from the human

mind itself. In the first place, natural antagonism might be looked for from the two opposed sects, the one of whom, in despair of knowledge, maintained that all science was impossible; while the other, resting on authority and on the learning that had been handed down from the Greeks, declared that science was already completely known, and consequently devoted their energies to methodizing and elaborating it. Secondly, within the domain of science itself, properly so called, there were two "kind of rovers" who must be dismissed. The first were the speculative or logical philosophers, who construe the universe *ex analogia hominis*, and not *ex analogia mundi*, who fashion nature according to preconceived ideas, and who employ in their investigations syllogism and abstract reasoning. The second class, who were equally offensive, consisted of those who practised blind experience, which is mere groping in the dark (*vaga experientia mera palpatio est*), who occasionally hit upon good works or inventions, which, like Atalanta's apples, distracted them from further steady and gradual progress towards universal truth. In place of these straggling efforts of the unassisted human mind, a graduated system of helps was to be supplied, by the use of which the mind, when placed on the right road, would proceed with unerring and mechanical certainty to the invention of new arts and sciences.

Such were to be the peculiar functions of the new method, though it has not definitely appeared what that method was, or to what objects it could be applied. But, before proceeding to unfold his method, Bacon found it necessary to enter in considerable detail upon the general subject of the obstacles to progress, and devoted nearly the whole of the first book of the *Organum* to the examination of them. This discussion, though strictly speaking extraneous to the scheme, has always been looked upon as a most important part of his philosophy, and his name is perhaps as much associated with the doctrine of Idols (*Idola*) as with the theory of induction or the classification of the sciences.

The doctrine of the kinds of fallacies or general classes of errors into which the human mind is prone to fall, appears in many of the works written before the *Novum Organum*, and the treatment of them varies in some respects. The classification in the *Organum*, however, not only has the author's sanction, but

has received the stamp of historical acceptation; and comparison of the earlier notices, though a point of literary interest, has no important philosophic bearing. The *Idola* (*Nov. Org.* i. 39) false notions of things, or erroneous ways of looking at nature, are of four kinds: the first two innate, pertaining to the very nature of the mind and not to be eradicated; the third creeping insensibly into men's minds, and hence in a sense innate and inseparable; the fourth imposed from without. The first kind are the *Idola Tribus*, idols of the tribe, fallacies incident to humanity or the race in general. Of these, the most prominent are — the proneness to suppose in nature greater order and regularity than there actually is; the tendency to support a preconceived opinion by affirmative instances, neglecting all negative or opposed cases; and the tendency to generalize from few observations, or to give reality to mere abstractions, figments of the mind. Manifold errors also result from the weakness of the senses, which affords scope for mere conjecture; from the influence exercised over the understanding by the will and passions; from the restless desire of the mind to penetrate to the ultimate principles of things; and from the belief that "man is the measure of the universe," whereas, in truth, the world is received by us in a distorted and erroneous manner. The second kind are the *Idola Specus*, idols of the cave, or errors incident to the peculiar mental or bodily constitution of each individual, for according to the state of the individual's mind is his view of things. Errors of this class are innumerable, because there are numberless varieties of disposition; but some very prominent specimens can be indicated. Such are the tendency to make all things subservient to, or take the colour of some favourite subject, the extreme fondness and reverence either for what is ancient or for what is modern, and excess in noting either differences or resemblances amongst things. A practical rule for avoiding these is also given: "In general let every student of nature take this as a rule, that whatever his mind seizes and dwells upon with particular satisfaction is to be held in suspicion". The third class are the *Idola Fori*, idols of the market-place, errors arising from the influence exercised over the mind by mere words. This, according to Bacon, is the most troublesome kind of error, and has been especially fatal in philosophy. For words introduce a

fallacious mode of looking at things in two ways: first, there are some words that are really merely names for non-existent things, which are yet supposed to exist simply because they have received a name; secondly, there are names hastily and unskilfully abstracted from a few objects and applied recklessly to all that has the faintest analogy with these objects, thus causing the grossest confusion. The fourth and last class are the *Idola Theatri*, idols of the theatre, *i.e.* fallacious modes of thinking resulting from received systems of philosophy and from erroneous methods of demonstration. The criticism of the demonstrations is introduced later in close connexion with Bacon's new method; they are the rival modes of procedure, to which his own is definitely opposed. The philosophies which are "redargued" are divided into three classes, the sophistical, of which the best example is Aristotle, who, according to Bacon, forces nature into his abstract schemata and thinks to explain by definitions; the empirical, which from few and limited experiments leaps at once to general conclusions; and the superstitious, which corrupts philosophy by the introduction of poetical and theological notions.

Such are the general causes of the errors that infest the human mind; by their exposure the way is cleared for the introduction of the new method. The nature of this method cannot be understood until it is exactly seen to what it is to be applied. What idea had Bacon of science, and how is his method connected with it? Now, the science which was specially and invariably contemplated by him was natural philosophy, the great mother of all the sciences; it was to him the type of scientific knowledge, and its method was the method of all true science. To discover exactly the characteristics and the object of natural philosophy it is necessary to examine the place it holds in the general scheme furnished in the *Advancement* or *De Augmentis*. All human knowledge, it is there laid down, may be referred to man's memory or imagination or reason. In the first, the bare facts presented to sense are collected and stored up; the exposition of them is *history*, which is either natural or civil. In the second, the materials of sense are separated or divided in ways not corresponding to nature but after the mind's own pleasure, and the result is *poesy* or feigned history. In the third, the materials are

worked up after the model or pattern of nature, though we are prone to err in the progress from sense to reason; the result is *philosophy*, which is concerned either with God, with nature or with man, the second being the most important. Natural philosophy is again divided into speculative or theoretical and operative or practical, according as the end is contemplation or works. Speculative or theoretical natural philosophy has to deal with natural substances and qualities and is subdivided into physics and metaphysics. Physics inquires into the efficient and material causes of things; metaphysics, into the formal and final causes. The principal objects of physics are concrete substances, or abstract though physical qualities. The research into abstract qualities, the fundamental problem of physics, comes near to the metaphysical study of *forms*, which indeed differs from the first only in being more general, and in having as its results a *form* strictly so called, *i.e.* a nature or quality which is a limitation or specific manifestation of some higher and better-known genus. Natural philosophy is, therefore, in ultimate resort the study of *forms*, and, consequently, the fundamental problem of philosophy in general is the discovery of these *forms*.

"On a given body to generate or superinduce a new nature or natures, is the work and aim of human power.... Of a given nature to discover the form or true specific difference, or nature-engendering nature (*natura naturans*) or source of emanation (for these are the terms which are nearest to a description of the thing), is the work and aim of human knowledge."

The questions, then, whose answers give the key to the whole Baconian philosophy, may be put briefly thus — What are forms? and how is it that knowledge of them solves both the theoretical and the practical problem of science? Bacon himself, as may be seen from the passage quoted above, finds great difficulty in giving an adequate and exact definition of what he means by a form. As a general description, the following passage from the *Novum Organum*, ii. 4, may be cited: — "The form of a nature is such that given the form the nature infallibly follows.... Again, the form is such that if it be taken away the nature infallibly vanishes.... Lastly, the true form is such that it deduces the

given nature from some source of being which is inherent in more natures, and which is better known in the natural order of things than the form itself."

From this it would appear that, since by a *nature* is meant some sensible quality, superinduced upon, or possessed by, a body, so by a form we are to understand the cause of that nature, which cause is itself a determinate case or manifestation of some general or abstract quality inherent in a greater number of objects. But all these are mostly marks by which a form may be recognized, and do not explain what the form really is. A further definition is accordingly attempted in Aph. 13: — "The form of a thing is the very thing itself, and the thing differs from the form no otherwise than as the apparent differs from the real, or the external from the internal, or the thing in reference to the man from the thing in reference to the universe."

This throws a new light on the question, and from it the inference at once follows, that the forms are the permanent causes or substances underlying all visible phenomena, which are merely manifestations of their activity. Are the forms, then, forces? At times it seems as if Bacon had approximated to this view of the nature of things, for in several passages he identifies forms with laws of activity. Thus, he says — "When I speak of forms I mean nothing more than those laws and determinations of absolute actuality which govern and constitute any simple nature, as heat, light, weight, in every kind of matter and subject that is susceptible of them. Thus the form of heat or the form of light is the same thing as the law of heat or the law of light." "Matter rather than forms should be the object of our attention, its configurations and changes of configuration, and simple action, and law of action or motion; for forms are figments of the human mind, unless you will call those laws of action forms." "Forms or true differences of things, which are in fact laws of pure act." "For though in nature nothing really exists besides individual bodies, performing pure individual acts according to a fixed law, yet in philosophy this very law, and the investigation, discovery and explanation of it, is the foundation as well of knowledge as of operation. And it is this law, with its clauses, that I mean when I speak of forms."

Several important conclusions may be drawn from these passages. In the first place, it is evident that Bacon, like the Atomical school, of whom he highly approved, had a clear perception and a firm grasp of the *physical* character of natural principles; his *forms* are no ideas or abstractions, but highly general physical properties. Further, it is hinted that these general qualities may be looked upon as the modes of action of simple bodies. This fruitful conception, however, Bacon does not work out; and though he uses the word *cause*, and identifies *form* with *formal cause*, yet it is perfectly apparent that the modern notions of cause as dynamical, and of nature as in a process of flow or development, are foreign to him, and that in his view of the ultimate problem of science, cause meant *causa immanens*, or underlying substance, effects were not consequents but manifestations, and nature was regarded in a purely statical aspect. That this is so appears even more clearly when we examine his general conception of the unity, gradation and function of the sciences. That the sciences are organically connected is a thought common to him and to his distinguished predecessor Roger Bacon. "I that hold it for a great impediment towards the advancement and further invention of knowledge, that particular arts and sciences have been disincorporated from general knowledge, do not understand one and the same thing which Cicero's discourse and the note and conceit of the Grecians in their word *circle learning* do intend. For I mean not that use which one science hath of another for ornament or help in practice; but I mean it directly of that use by way of supply of light and information, which the particulars and instances of one science do yield and present for the framing or correcting of the axioms of another science in their very truth and notion." In accordance with this, Bacon placed at the basis of the particular sciences which treat of God, nature and man, one fundamental doctrine, the *Prima Philosophia*, or first philosophy, the function of which was to display the unity of nature by connecting into one body of truth such of the highest axioms of the subordinate sciences as were not special to one science, but common to several. This first philosophy had also to investigate what are called the adventitious or transcendental conditions of essences, such as Much, Little, Like, Unlike,

Possible, Impossible, Being, Nothing, the logical discussion of which certainly belonged rather to the laws of reasoning than to the existence of things, but the physical or real treatment of which might be expected to yield answers to such questions as, why certain substances are numerous, others scarce; or why, if like attracts like, iron does not attract iron. Following this summary philosophy come the sciences proper, rising like a pyramid in successive stages, the lowest floor being occupied by natural history or experience, the second by physics, the third, which is next the peak of unity, by metaphysics. The knowledge of the peak, or of the one law which binds nature together, is perhaps denied to man. Of the sciences, physics, as has been already seen, deals with the efficient and material, *i.e.* with the variable and transient, causes of things. But its inquiries may be directed either towards concrete bodies or towards abstract qualities. The first kind of investigation rises little above mere natural history; but the other is more important and paves the way for metaphysics. It handles the configurations and the appetites or motions of matter. The configurations, or inner structure of bodies, include dense, rare, heavy, light, hot, cold, &c., — in fact, what are elsewhere called simple natures. Motions are either simple or compound, the latter being the sum of a number of the former. In physics, however, these matters are treated only as regards their material or efficient causes, and the result of inquiry into any one case gives no general rule, but only facilitates invention in some similar instance. Metaphysics, on the other hand, treats of the formal or final cause of these same substances and qualities, and results in a general rule. With regard to forms, the investigation may be directed either towards concrete bodies or towards qualities. But the forms of substances "are so perplexed and complicated, that it is either vain to inquire into them at all, or such inquiry as is possible should be put off for a time, and not entered upon till forms of a more simple nature have been rightly investigated and discussed." "To inquire into the form of a lion, of an oak, or gold, nay, even of water or air, is a vain pursuit; but to inquire the *form* of dense, rare, hot, cold, &c., as well configurations as motions, which in treating of physic I have in great part enumerated (I call them forms of the first class), and which (like the letters of the

alphabet) are not many, and yet make up and sustain the essences and forms of all substances — this, I say, it is which I am attempting, and which constitutes and defines that part of metaphysic of which we are now inquiring." Physics inquires into the same qualities, but does not push its investigations into ultimate reality or reach the more general causes. We thus at last attain a definite conclusion with regard to forms, and it appears clear that in Bacon's belief the true function of science was the search for a few fundamental physical qualities, highly abstract and general, the combinations of which give rise to the simple natures and complex phenomena around us. His general conception of the universe may therefore be called mechanical or statical; the cause of each phenomenon is supposed to be actually contained in the phenomenon itself, and by a sufficiently accurate process could be sifted out and brought to light. As soon as the causes are known man regains his power over nature, for "whosoever knows any form, knows also the utmost possibility of superinducing that nature upon every variety of matter, and so is less restrained and tied in operation either to the basis of the matter or to the condition of the efficients."

Nature thus presented itself to Bacon's mind as a huge congeries of phenomena, the manifestations of some simple and primitive qualities, which were hid from us by the complexity of the things themselves. The world was a vast labyrinth, amid the windings of which we require some clue or thread whereby we may track our way to knowledge and thence to power. This thread, the *filum labyrinthi*, is the new method of *induction*. But, as has been frequently pointed out, the new method could not be applied until facts had been observed and collected. This is an indispensable preliminary. "Man, the servant and interpreter of nature, can do and understand so much, and so much only, as he has observed in fact or in thought of the course of nature; beyond this he neither knows anything nor can do anything." The proposition that our knowledge of nature necessarily begins with observation and experience, is common to Bacon and many contemporary reformers of science, but he laid peculiar stress upon it, and gave it a new meaning. What he really meant by observation was a competent natural history or collection of facts. "The firm foundations of a purer

natural philosophy are laid in natural history." "First of all we must prepare a *natural and experimental history*, sufficient and good; and this is the foundation of all." The senses and the memory, which collect and store up facts, must be assisted; there must be a *ministration* of the senses and another of the memory. For not only are instances required, but these must be arranged in such a manner as not to distract or confuse the mind, *i.e.* tables and arrangements of instances must be constructed. In the preliminary collection the greatest care must be taken that the mind be absolutely free from preconceived ideas; nature is only to be conquered by obedience; man must be merely receptive. "All depends on keeping the eye steadily fixed upon the facts of nature, and so receiving their images simply as they are; for God forbid that we should give out a dream of our own imagination for a pattern of the world; rather may He graciously grant to us to write an apocalypse or true vision of the footsteps of the Creator imprinted on his creatures." Concealed among the facts presented to sense are the causes or forms, and the problem therefore is so to analyse experience, so to break it up into pieces, that we shall with certainty and mechanical ease arrive at a true conclusion. This process, which forms the essence of the new method, may in its entirety, as a ministration to the reason, be called a logic; but it differs widely from the ordinary or school logic in end, method and form. Its aim is to acquire command over nature by knowledge, and to invent new arts, whereas the old logic strove only after dialectic victories and the discovery of new arguments. In method the difference is even more fundamental. Hitherto the mode of demonstration had been by the syllogism; but the syllogism is, in many respects, an incompetent weapon. It is compelled to accept its first principles on trust from the science in which it is employed; it cannot cope with the subtlety of nature; and it is radically vitiated by being founded on hastily and inaccurately abstracted notions of things. For a syllogism consists of propositions, propositions of words, and words are the symbols of notions. Now the first step in accurate progress from sense to reason, or true philosophy, is to frame a *bona notio* or accurate conception of the thing; but the received logic never does this. It flies off at once from experience and particulars to the highest and most

general propositions, and from these descends, by the use of middle terms, to axioms of lower generality. Such a mode of procedure may be called *anticipatio naturae* (for in it reason is allowed to prescribe to things), and is opposed to the true method, the *interpretatio naturae*, in which reason follows and obeys nature, discovering her secrets by obedience and submission to rule. Lastly, the very form of induction that has been used by logicians in the collection of their instances is a weak and useless thing. It is a mere enumeration of a few known facts, makes no use of exclusions or rejections, concludes precariously, and is always liable to be overthrown by a negative instance. In radical opposition to this method the Baconian induction begins by supplying helps and guides to the senses, whose unassisted information could not be relied on. Notions were formed carefully, and not till after a certain process of induction was completed. The formation of axioms was to be carried on by a gradually ascending scale. "Then and only then may we hope well of the sciences, when in a just scale of ascent and by successive steps, not interrupted or broken, we rise from particulars to lesser axioms; and then to middle axioms, one above the other; and last of all to the most general." Finally the very form of induction itself must be new. "The induction which is to be available for the discovery and demonstration of sciences and arts must analyse nature by proper rejections and exclusions; and then, after a sufficient number of negatives, come to a conclusion on the affirmative instances, which has not yet been done, or even attempted, save only by Plato. ... And this induction must be used not only to discover axioms, but also in the formation of notions." This view of the function of exclusion is closely connected with Bacon's doctrine of forms, and is in fact dependent upon that theory. But induction is neither the whole of the new method, nor is it applicable to forms only. There are two other grand objects of inquiry: the one, the transformation of concrete bodies; the other, the investigation of the latent powers and the latent schematism or configuration. With regard to the first, in ultimate result it depends upon the theory of forms; for whenever the compound body can be regarded as the sum of certain simple natures, then our knowledge of the forms of these natures gives us the power of

superinducing a new nature on the concrete body. As regards the latent process (*latens processus*) which goes on in all cases of generation and continuous development or motion, we examine carefully, and by quantitative measurements, the gradual growth and change from the first elements to the completed thing. The same kind of investigation may be extended to many cases of natural motion, such as voluntary action or nutrition; and though inquiry is here directed towards concrete bodies, and does not therefore penetrate so deeply into reality as in research for forms, yet great results may be looked for with more confidence. It is to be regretted that Bacon did not complete this portion of his work, in which for the first time he approaches modern conceptions of change. The latent configuration (*latens schematismus*) or inward structure of the parts of a body must be known before we can hope to superinduce a new nature upon it. This can only be discovered by analysis, which will disclose the ultimate constituents (natural particles, not atoms) of bodies, and lead back the discussion to forms or simple natures, whereby alone can true light be thrown on these obscure questions. Thus, in all cases, scientific explanation depends upon knowledge of forms; all phenomena or secondary qualities are accounted for by being referred to the primary qualities of matter.

The several steps in the inductive investigation of the form of any nature flow readily from the definition of the form itself. For that is always and necessarily present when the nature is present, absent when it is absent, decreases and increases according as the nature decreases and increases. It is therefore requisite for the inquiry to have before us instances in which the nature is present. The list of these is called the table of *Essence and Presence*. Secondly, we must have instances in which the nature is absent; only as such cases might be infinite, attention should be limited to such of them as are most akin to the instances of presence. The list in this case is called table of *Absence in Proximity*. Thirdly, we must have a number of instances in which the nature is present in different degrees, either increasing or decreasing in the same subject, or variously present in different subjects. This is the table of *Degrees*, or *Comparison*. After the formation of these tables, we proceed to apply what is perhaps the most valuable

part of the Baconian method, and that in which the author took most pride, the process of exclusion or rejection. This elimination of the non-essential, grounded on the fundamental propositions with regard to forms, is the most important of Bacon's contributions to the logic of induction, and that in which, as he repeatedly says, his method differs from all previous philosophies. It is evident that if the tables were complete, and our notions of the respective phenomena clear, the process of exclusion would be a merely mechanical *counting out*, and would *infallibly* lead to the detection of the cause or form. But it is just as evident that these conditions can never be adequately fulfilled. Bacon saw that his method was impracticable (though he seems to have thought the difficulties not insuperable), and therefore set to work to devise new helps, *adminicula*. These he enumerates in ii., *Aph.* 21: — *Prerogative Instances, Supports of Induction, Rectification of Induction, Varying the Investigation according to the Nature of the Subject, Prerogative Natures, Limits of Investigation, Application to Practice, Preparations for Investigation, the Ascending and Descending Scale of Axioms*. The remainder of the *Organum* is devoted to a consideration of the twenty-seven classes of Prerogative Instances, and though it contains much that is both luminous and helpful, it adds little to our knowledge of what constitutes the Baconian method. On the other heads we have but a few scattered hints. But although the rigorous requirements of science could only be fulfilled by the employment of all these means, yet in their absence it was permissible to draw from the tables and the exclusion a hypothetical conclusion, the truth of which might be verified by the use of the other processes; such an hypothesis is called fantastically the First Vintage (*Vindemiatio*). The inductive method, so far as exhibited in the *Organum*, is exemplified by an investigation into the nature of heat.

Such was the method devised by Bacon, and to which he ascribed the qualities of absolute certainty and mechanical simplicity. But even supposing that this method were accurate and completely unfolded, it is evident that it could only be made applicable and produce fruit when the phenomena of the universe have been very completely tabulated and arranged. In this demand for a

complete natural history, Bacon also felt that he was original, and he was deeply impressed with the necessity for it; in fact, he seems occasionally to place an even higher value upon it than upon his *Organum*. Thus, in the preface to his series of works forming the third part of the *Instauratio*, he says: "It comes, therefore, to this, that my *Organum*, even if it were completed, would not without the *Natural History* much advance the *Instauration of the Sciences*, whereas the *Natural History* without the *Organum* would advance it not a little." But a complete natural history is evidently a thing impossible, and in fact a history can only be collected by attending to the requirements of the *Organum*. This was seen by Bacon, and what may be regarded as his final opinion on the question is given in the important letter to Jean Antoine Baranzano ("Redemptus": 1590-1622):— "With regard to the multitude of instances by which men may be deterred from the attempt, here is my answer. First, what need to dissemble? Either store of instances must be procured, or the business must be given up. All other ways, however enticing, are impassable. Secondly, the prerogatives of instances, and the mode of experimenting upon experiments of light (which I shall hereafter explain), will diminish the multitude of them very much. Thirdly, what matter, I ask, if the description of the instances should fill six times as many volumes as Pliny's *History*? ... For the true natural history is to take nothing except instances, connections, observations and canons". The *Organum* and the *History* are thus correlative, and form the two equally necessary sides of a true philosophy; by their union the new philosophy is produced.

Summary. — Two questions may be put to any doctrine which professes to effect a radical change in philosophy or science. Is it original? Is it valuable? With regard to the first, it has been already pointed out that Bacon's induction or inductive method is distinctly his own, though it cannot and need not be maintained that the general spirit of his philosophy was entirely new.

The value of the method is the separate and more difficult question. It has been assailed on the most opposite grounds. Macaulay, while admitting the *accuracy* of the process, denied its efficiency, on the ground that an operation

performed naturally was not rendered more easy or efficacious by being subjected to analysis. This objection is curious when confronted with Bacon's reiterated assertion that the *natural* method pursued by the unassisted human reason is distinctly opposed to his; and it is besides an argument that tells so strongly against many sciences, as to be comparatively worthless when applied to any one. There are, however, more formidable objections against the method. It has been pointed out, and with perfect justice, that science in its progress has not followed the Baconian method, that no one discovery can be pointed to which can be definitely ascribed to the use of his rules, and that men the most celebrated for their scientific acquirements, while paying homage to the name of Bacon, practically set at naught his most cherished precepts. The reason of this is not far to seek, and has been pointed out by logicians of the most diametrically opposed schools. The mechanical character both of the natural history and of the logical method applied to it resulted necessarily from Bacon's radically false conception of the nature of cause and of the causal relation. The whole logical or scientific problem is treated as if it were one of co-existence, to which in truth the method of exclusion is scarcely applicable, and the assumption is constantly made that each phenomenon has one and only one cause. The inductive formation of axioms by a gradually ascending scale is a route which no science has ever followed, and by which no science could ever make progress. The true scientific procedure is by hypothesis followed up and tested by verification; the most powerful instrument is the deductive method, which Bacon can hardly be said to have recognized. The power of framing hypothesis points to another want in the Baconian doctrine. If that power form part of the true method, then the mind is not wholly passive or recipient; it anticipates nature, and moulds the experience received by it in accordance with its own constructive ideas or conceptions; and yet further, the minds of various investigators can never be reduced to the same dead mechanical level. There will still be room for the scientific use of the imagination and for the creative flashes of genius.

If, then, Bacon himself made no contributions to science, if no discovery can be shown to be due to the use of his rules, if his method be logically defective,

and the problem to which it was applied one from its nature incapable of adequate solution, it may not unreasonably be asked, How has he come to be looked upon as the great leader in the reformation of modern science? How is it that he shares with Descartes the honour of inaugurating modern philosophy? To this the true answer seems to be that Bacon owes his position not only to the general spirit of his philosophy, but to the manner in which he worked into a connected system the new mode of thinking, and to the incomparable power and eloquence with which he expounded and enforced it. Like all epoch-making works, the *Novum Organum* gave expression to ideas which were already beginning to be in the air. The time was ripe for a great change; scholasticism, long decaying, had begun to fall; the authority not only of school doctrines but of the church had been discarded; while here and there a few devoted experimenters were turning with fresh zeal to the unwithered face of nature. The fruitful thoughts which lay under and gave rise to these scattered efforts of the human mind, were gathered up into unity, and reduced to system in the new philosophy of Bacon. It is assuredly little matter for wonder that this philosophy should contain much that is now inapplicable, and that in many respects it should be vitiated by radical errors. The details of the logical method on which its author laid the greatest stress have not been found of practical service; yet the fundamental ideas on which the theory rested, the need for rejecting rash generalization, and the necessity for a critical analysis of experience, are as true and valuable now as they were then. Progress in scientific discovery is made mainly, if not solely, by the employment of hypothesis, and for that no code of rules can be laid down such as Bacon had devised. Yet the framing of hypothesis is no mere random guesswork; it is left not to the imagination alone, but to the *scientific imagination*. There is required in the process not merely a preliminary critical induction, but a subsequent experimental comparison, verification or proof, the canons of which can be laid down with precision. To formulate and show grounds for these laws is to construct a philosophy of induction, and it must not be forgotten that the first step towards the accomplishment of the task

was made by Bacon when he introduced and gave prominence to the powerful logical instrument of exclusion or elimination.

It is curious and significant that in the domain of the moral and metaphysical sciences his influence has been perhaps more powerful, and his authority has been more frequently appealed to, than in that of the physical. This is due, not so much to his expressed opinion that the inductive method was applicable to all the sciences, as to the generally practical, or, one may say, *positive* spirit of his system. Theological questions, which had tortured the minds of generations, are by him relegated from the province of reason to that of faith. Even reason must be restrained from striving after ultimate truth; it is one of the errors of the human intellect that it will not rest in general principles, but must push its investigations deeper. Experience and observation are the only remedies against prejudice and error. Into questions of metaphysics, as commonly understood, Bacon can hardly be said to have entered, but a long line of thinkers have drawn inspiration from him, and it is not without justice that he has been looked upon as the originator and guiding spirit of what is known as the empirical school.

Bacon's Influence. — It is impossible within our limits to do more than indicate the influence which Bacon's views have had on subsequent thinkers. The most valuable and complete discussion of the subject is contained in T. Fowler's edition of the *Novum Organum* (introd. § 14). It is there argued that, both in philosophy and in natural science, Bacon's influence was immediate and lasting. Under the former head it is pointed out (i.) that the fundamental principle of Locke's *Essay*, that all our ideas are product of sensation and reflection, is briefly stated in the first aphorism of the *Novum Organum*, and (ii.) that the whole atmosphere of that treatise is characteristic of the *Essay*. Bacon is, therefore, regarded by many as the father of what is most characteristic in English psychological speculation. As he himself said, he "rang the bell which called the wits together." In the sphere of ethics he is similarly regarded as a forerunner of the empirical method. The spirit of the *De Augmentis* (bk. vii.) and the inductive method which is discussed in the *Novum Organum* are at the root of all theories which have constructed a moral code by an inductive examination

of human consciousness and the results of actions. Among such theories utilitarianism especially is the natural result of the application to the phenomenon of conduct of the Baconian experimental method. In this connexion, however, it is important to notice that Hobbes, who had been Bacon's secretary, makes no mention of Baconian induction, nor does he in any of his works make any critical reference to Bacon himself. It would, therefore, appear that Bacon's influence was not immediate.

In the sphere of natural science, Bacon's importance is attested by references to his work in the writings of the principal scientists, not only English, but French, German and Italian. Fowler (*op. cit.*) has collected from Descartes, Gassendi, S. Sorbière, Jean Baptiste du Hamel, quotations which show how highly Bacon was regarded by the leaders of the new scientific movement. Sorbière, who was by no means partial to things English, definitely speaks of him as "celuy qui a le plus puissamment solicité les interests de la physique, et excité le monde à faire des expériences" (*Relation d'un voyage en Angleterre*, Cologne, 1666, p-64). It was, however, Voltaire and the encyclopaedists who raised Bacon to the pinnacle of his fame in France, and hailed him as "le père de la philosophie expérimentale" (*Lettres sur les Anglois*). Condillac, in the same spirit, says of him, "personne n'a mieux connu que lui la cause de nos erreurs." So the *Encyclopédie*, besides giving a eulogistic article "Baconisme," speaks of him (in d'Alembert's preliminary discourse) as "le plus grand, le plus universel, et le plus éloquent des philosophes." Among other writers, Leibnitz and Huygens give testimony which is the more valuable as being critical. Leibnitz speaks of Bacon as "divini ingenii vir," and, like several other German authors, classes him with Campanella; Huygens refers to his "bonnes méthodes." If, however, we are to attach weight to English writers of the latter half of the 17th century, we shall find that one of Bacon's greatest achievements was the impetus given by his *New Atlantis* to the foundation of the Royal Society (*q.v.*). Dr Thomas Sprat (1635-1713), bishop of Rochester and first historian of the society, says that Bacon of all others "had the true imagination of the whole extent" of the enterprise, and that in his works are to be found the best arguments

for the experimental method of natural philosophy (*Hist. of the Royal Society*, p-36, and Thomas Tenison's *Baconiana*, p-266). In this connexion reference should be made also to Cowley's *Ode to the Royal Society*, and to Dr John Wallis's remarks in Hearne's *Preface to P. Langtoft's Chronicle* (appendix, num. xi.). Joseph Glanvill, in his *Scepsis Scientifica* (dedication) says, "Solomon's house in the *New Atlantis* was a prophetic scheme of the Royal Society"; and Henry Oldenburg (*c.* 1615-1677), one of the first secretaries of the society, speaks of the new eagerness to obtain scientific data as "a work begun by the single care and conduct of the excellent Lord Verulam." Boyle, in whose works there are frequent eulogistic references to Bacon, regarded himself as a disciple and was indeed known as a second Bacon. The predominating influence of Bacon's philosophy is thus clearly established in the generation which succeeded his own. There is abundant evidence to show that in the universities of Oxford and Cambridge (especially the latter) the new spirit had already modified the old curricula. Bacon has frequently been disparaged on the ground that his name is not mentioned by Sir Isaac Newton. It can be shown, however, that Newton was not ignorant of Bacon's works, and Dr Fowler explains his silence with regard to them on three grounds: (1) that Bacon's reputation was so well established that any definite mention was unnecessary, (2) that it was not customary at the time to acknowledge indebtedness to contemporary and recent writers, and (3) that Newton's genius was so strongly mathematical (whereas Bacon's great weakness was in mathematics) that he had no special reason to refer to Bacon's experimental principles.

If the foregoing examples are held sufficient to establish the influence of Bacon on the intellectual development of his immediate successors, it follows that the whole trend of typically English thought, not only in natural science, but also in mental, moral and political philosophy, is the logical fulfilment of Baconian principles. He argued against the tyranny of authority, the vagaries of unfettered imagination and the academic aims of unpractical dialectic; the vital energy and the reasoned optimism of his language entirely outweigh the fact that his contributions to the stock of actual scientific knowledge were practically

inconsiderable. It may be freely admitted that in the domain of logic there is nothing in the *Organum* that has not been more instructively analysed either by Aristotle himself or in modern works; at the same time, there is probably no work which is a better and more stimulating introduction to logical study. Its terse, epigrammatic phrases sink into the fibre of the mind, and are a healthy warning against crude, immature generalization.

While, therefore, it is a profound mistake to regard Bacon as a great constructive philosopher, or even as a lonely pioneer of modern thought, it is quite unfair to speak of him as a trifler. His great work consists in the fact that he summed up the faults which the widening of knowledge had disclosed in medieval thought, and in this sense he stands high among those who were in many parts of 16th-century Europe striving towards a new intellectual activity.

Bibliography. *Editions*. — The classical edition is that of R. L. Ellis, J. Spedding and D. D. Heath, 1st ed., 1857; 2nd ed., 1870 (vols. i.-iii., philosophical writings; iv.-v., translations; vi.-vii., literary and professional works). B. Montagu's edition (17 vols., 1825-1834) is full but unscholarly. An extremely useful reprint (in one volume) of the philosophical works (with a few not strictly philosophical), based on the first Ellis-Spedding edition, was published by J. M. Robertson (London, 1905); besides the original introductions, it contains a useful summary by the editor of the various problems of Bacon's life and thought. Numerous cheap editions have lately been published, *e.g.* in the "World's Classics" (1901), and "New Universal Library" series (1905); Sidney Lee, *English Works of Francis Bacon* (London, 1905).

Of particular works there are numerous editions in all the chief languages. The following are the most important: — T. Fowler, *Novum Organum* (Oxford, 1878; ed. 1889), with notes, full introduction on Bacon's philosophy in all its relations, and a most valuable bibliography. This superseded the edition of G. W. Kitchin (Oxford, 1855). The *Essays* have been edited more than twenty times since 1870; the following editions may be mentioned: — Archbishop Whately (6th ed., 1864); W. Aldis Wright (Lond., 1862); F. Storr and Gibson (Lond., 1886); E. A. Abbott (Lond., 1879); John Buchan (Lond., 1879); A. S. West

(Cambridge, 1897); W. Evans (Edinburgh, 1897). A facsimile reprint of the 1st edition was published in New York (1904). *Advancement of Learning*: — W. Aldis Wright (Camb., 1866; 5th ed., 1900); F. G. Selby (1892-1895); H. Morley (1905); and, with the *New Atlantis*, in the "World's Classics" series (introduction by Prof. T. Case, Lond., 1906). *Wisdom of the Ancients and New Atlantis*, in "Cassell's National Library" (1886 and 1903). G. C. M. Smith, *New Atlantis* (1900). J. Fürstenhagen, *Kleinere Schriften* (Leipzig, 1884).

Biography. — J. Spedding, *The Life and Letters of Lord Bacon* (1861), *Life and Times of Francis Bacon* (1878); also Dr Rawley's *Life* in the Ellis-Spedding editions, and J. M. Robertson's reprint (above); W. Hepworth Dixon, *Personal History of Lord Bacon* (Lond., 1861), and *Story of Lord Bacon's Life* (*ib.* 1862); John Campbell, *Lives of the Chancellors* (Lond., 1845), ii. 51; P. Woodward, *Early Life of Lord Bacon* (1902); T. Fowler, *Francis Bacon* in "English Philos." series (Lond., 1881); R. W. Church's *Bacon*, in "Men of Letters" series (1884).

Philosophy. — Beside the introductions in the Ellis-Spedding and T. Fowler editions, and general histories of philosophy, see: — Kuno Fischer, *Fr. Bacon* (1856, 2nd ed., 1875, Eng. trans. by John Oxenford, Lond., 1857); Ch. de Rémusat, *Bacon, sa vie ... et son influence* (1857, ed. 1858 and 1877); G. L. Craik, *Lord Bacon, his Writings and his Philosophy* (3 vols., 1846-1847, ed. 1860); A. Dorner, *De Baconis Philosophia* (Berlin, 1867; London, 1886); J. v. Liebig, *Über F. B. v. Verulam* (Mannheim, 1863); Ad. Lasson, *Über B. v. Verulam's wissenschaftliche Principien* (Berl., 1860); E. H. Böhmer, *Über F. B. v. Verulam* (Erlangen, 1864); Ch. Adam, *Philos. de Francis Bacon* (Paris, 1890); Barthélemy St Hilaire, *Étude sur Francis Bacon* (Paris, 1890); R. W. Church, *op. cit.*; H. Heussler, *F. Bacon und seine geschichtliche Stellung* (Breslau, 1889); H. Höffding, *History of Modern Philosophy* (Eng. trans., 1900); J. M. Robertson, *Short History of Freethought* (Lond., 1906); Sidney Lee, *Great Englishmen of the 16th century* (Lond., 1904). For the relations between Bacon and Ben Jonson see *The Tale of the Shakespeare Epitaphs by Francis Bacon* (New York, 1888); for Bacon's poetical gifts see an article in the *Fortnightly Review* (March 1905).

The Delphi Classics Catalogue

We are proud to present a listing of our complete catalogue of English titles, with new titles being added every month. Buying direct from our website means you can make great savings and take advantage of our instant Updates service. You can even purchase an entire series (Super Set) at a special discounted price.

Only from our website can readers purchase a complete *Parts Edition* of our titles. When you buy a Parts Edition, you will receive a folder of your chosen author's works, with each novel, play, poetry collection, non-fiction book and more divided into its own special volume. This allows you to read individual novels *etc.* and to know precisely where you are in an eBook. For more information, please visit our *Parts Edition* page.

St. Michael's Church, St. Albans, Hertfordshire — Bacon's final resting place

The monument to Bacon close to his grave
